**CR OSCILLATOR**

# **OUTLINES/CONTENTS**

## **OUTLINES**

MODEL AG-203 is the most popular audio generator which offers the highest performance characteristics such as wide frequency range, high output, and low distortion factor. The oscillating frequency is continuously variable from 10 Hz to 1 MHz, maximum output voltage is 7V rms, and output impedance is only 600Ω.

This type of audio generator is applicable to acoustic measurements for frequency and phase characteristics and for distortion factor. It is also used as a modulation signal source.

# SPECIFICATIONS

Frequency Range	
x 1 Range	10 Hz ~ 100 Hz
x 10 Range	100 Hz ~ 1 kHz
x 100 Range	1 kHz ~ 10 kHz
x 1 k Range	10 kHz ~ 100 kHz
x 10 k Range	100 kHz ~ 1 MHz
Frequency Accuracy	±(3% + 1 Hz)

## SINE WAVE CHARACTERISTICS

Output Voltage (no load)	7V rms or more
Frequency Characteristic 10 Hz ~ 1 MHz (Reference Freq 1 kHz)	±0.5 dB
Distortion Factor 400 Hz ~ 20 kHz	0.1% or less
100 Hz ~ 100 kHz	0.3% or less (10 range for 100 Hz)
50 Hz ~ 200 kHz	0.5% or less
20 Hz ~ 500 kHz	1% or less
10 Hz ~ 1 MHz	1.5% or less

## SQUARE WAVE CHARACTERISTICS

Output Voltage (no load)	10V p-p or more
Sag	5% or less (at 50 Hz)
Rise and Fall Times	200ns or less
Overshoot	2% or less (at 1 kHz, max. output)
Duty Ratio	50% ±5% (at 1 kHz, max. output)

## EXTERNAL SYNCHRONIZATION CHARACTERISTICS

Synchronizing Range	±1%/V
Max. Allowable Input Voltage	10V rms
Input Impedance	Approx. 10 kΩ
Output Impedance	600Ω ±10%
Output Attenuator	0 dB, -10 dB, -20 dB, -30 dB, -40 dB and -50 dB in 6 steps (accuracy: ±1 dB at 600Ω load)

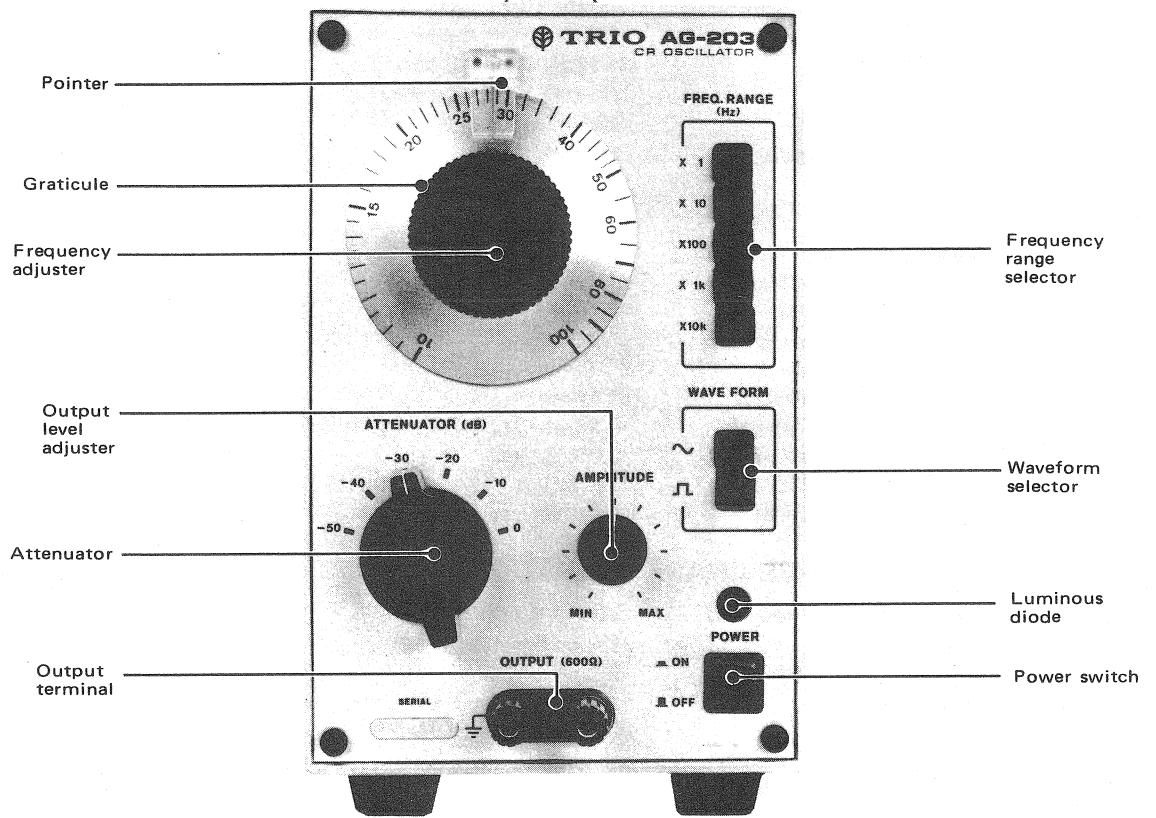

## STABILITY AGAINST POWER SOURCE VOLTAGE VARIATION

(with respect to variation of 100V ±10%)

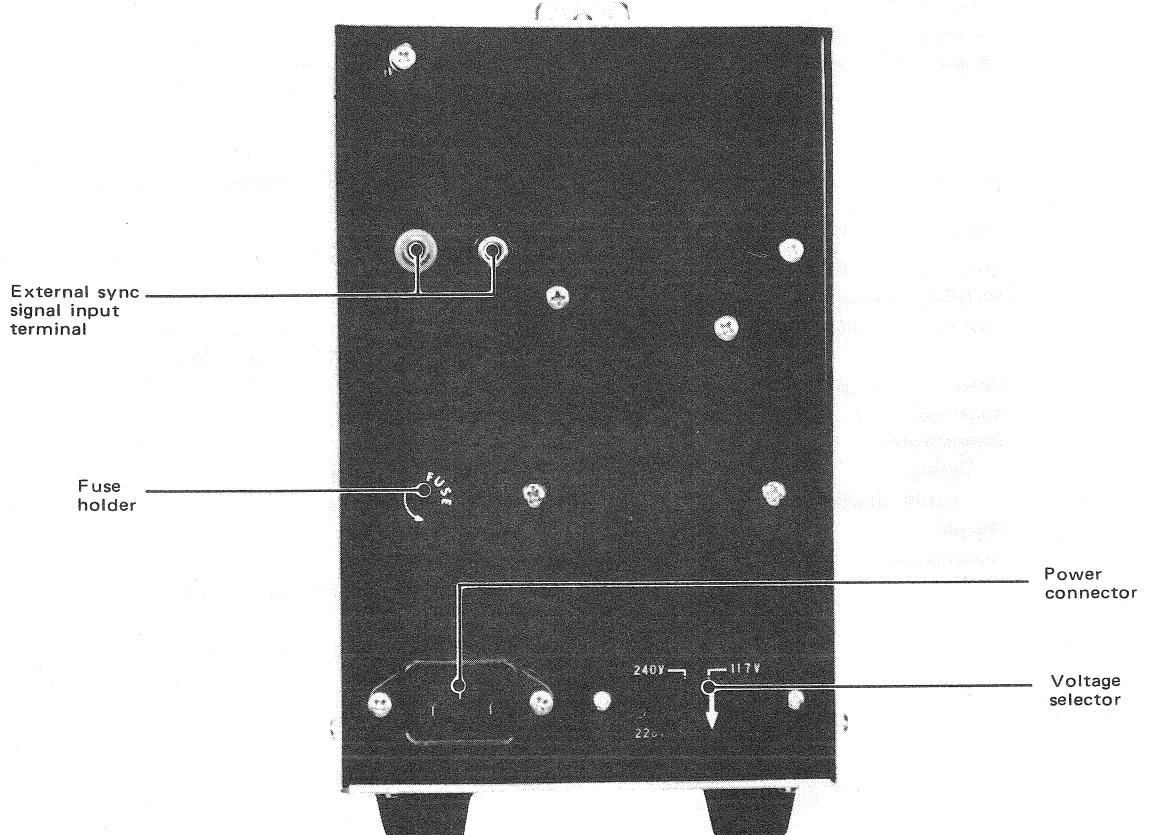

Frequency Drift	Within ±0.5%
Output Voltage Variation	Within ±0.5dB
Operating Temperature	0 ~ 50°C (relative humidity: Less than 90%)
Power Consumption	AC 100V (120V, 220V or 240V), 50 ~ 60 Hz
External View	5 watts
Dimensions	See Fig. 2 on page 9.
Casing	128(W) x 238(D) x 190(H) mm
Overall (including knobs)	130(W) x 268(D) x 215(H) mm
Weight	2.9 kg
Accessories	Power cord (1) Output cord: one red and black test cord with basket clip and banana plug Banana plug: red (1) and black (1) Fuse: 0.1A (2) and 0.2A (2) Instruction manual (1)

# CIRCUIT DESCRIPTION

## 1. SUMMARY

When reading the following descriptions, refer to the block diagram (Fig. 1) and the schematic diagram.

The sine wave signal generated by the Wien bridge oscillator circuit is fed through the WAVEFORM selector switch set to the "~~" position to the OUTPUT control, by means of which it is adjusted to any desired voltage.

If the WAVEFORM switch is in the "L" position, the sine wave signal is shaped into the square wave and the voltage is also adjusted by the OUTPUT control.

The signal voltage thus adjusted is applied to the output circuit, where its impedance is appropriately converted, and then delivered through an output attenuator to the output terminal. The attenuator provides selectable attenuations of 0 dB through -50 dB in 10 dB steps at  $600\Omega$  of output impedance.

## 2. WIEN BRIDGE OSCILLATOR CIRCUIT

The Wien bridge oscillator circuit elements consist of the resistance elements, which may be switched over for 5 ranges by the FREQ. RANGE switch, and the variable capacitor controlled by the FREQUENCY dial.

These elements provide a means of varying the oscillating frequency continuously over 10 times its frequency in one range, thus determining any desired frequency within the entire frequency range from 10 Hz to 1 MHz.

The amplifier circuit for the oscillator circuit is composed of a 2-stage differential amplifier and an output stage, employing a DC amplifier circuit. The first stage is a high input impedance circuit with FET while the driver stage is a wide band, high amplification type circuit with PNP transistors featuring high cut-off frequency. The output stage is an SEPP circuit using complementary transistors. The output voltage is fed back in positive polarity through

the oscillator elements to form an oscillating circuit, while it is also fed back in negative polarity through the nonlinear thermistor to stabilize the amplitude.

## 3. SQUARE WAVE SHAPING CIRCUIT

The square wave shaping circuit is a Schmidt-trigger circuit in which the sine wave signal from the oscillator circuit is shaped into a square wave. It is composed of an emitter coupled Schmidt-trigger circuit and a buffer amplifier, thus providing sufficient rising and falling characteristics.

## 4. OUTPUT CIRCUIT

The output circuit converts the impedance of signal from the OUTPUT control and feeds the signal to the output attenuator at a low impedance. It is an SEPP-OCL circuit employing complementary transistors to provide sufficiently low output impedance characteristics over the range from DC to 1 MHz.

## 5. OUTPUT ATTENUATOR

The 6-position output attenuator selects attenuations of 0 dB to -50 dB in 10 dB steps. In the 0 dB position with the OUTPUT control turned fully clockwise, the output voltage (sine wave at no-load time) is more than 7V rms.

## 6. POWER SUPPLY

The power supply circuit is powered by AC 240V (100V, 120V or 220V) and delivers DC $\pm$ 22V sufficiently stabilized by large-capacity smoothing capacitors ( $2200\mu\text{F} \times 2$ ) and a voltage stabilizer.

## ADJUSTMENTS

All the circuits of AG-203 are factory adjusted prior to shipment and no further adjustments are required, except for the frequency dial which may need readjustment for proper tracking, although this dial is also preadjusted at the factory. If readjustment is required, proceed to the adjusting work using accurate test equipment. Note that the power supply voltage must be calibrated before making adjustment (See Fig. 2).

1. Connect a frequency counter to OUTPUT terminal (4).
2. Remove the knob of the frequency dial, then loosen the set-screws on the dial.
3. Set FREQ. RANGE switch (6) to X 100 and adjust the shaft of the dial until the frequency counter indicates 1 kHz.
4. Set the dial to "10" position and tighten the set-screws, making sure that the shaft stays as it is. Check that the frequency counter is indicating 1 kHz, then secure the knob to the dial.
5. Set the dial to "100" position and adjust TC101 for a reading of 10 kHz on the frequency counter.
6. Set FREQ. RANGE switch (6) to X 1 and the frequency dial (8) to "10" position. Adjust VR101 until the frequency counter indicates 10 Hz.
7. Set FREQ. RANGE switch (6) to X 10k and the frequency dial (8) to "100" position. Adjust TC102 to 1 MHz on the frequency counter.
