**WARNING**

1. The following instructions are for use by qualified personnel only. To avoid electric shock, do not perform servicing other than contained in the operating instructions unless you are qualified to do so.
2. High voltage up to 12000 volts dc is present when the oscilloscope is operating. Line voltage

(100 to 240 VAC) is present on the power transformer, on-off switch, fuse holder, and line voltage selector any time the oscilloscope is connected to an ac power source, even if turned off. Always observe caution when the housing is removed from the unit. Contacting exposed high voltage could result in fatal electric shock.

# SAFETY

## SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. The specified voltage is shown at the fuse holder of the AC inlet. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

### Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

### Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the oscilloscope at earth ground. Do not attempt to defeat the ground wire connection or float the oscilloscope; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

The optional power cords are shown as follows in Fig. 1.

### Line fuse

The fuse holder is located on the rear panel and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

### Voltage conversion

This oscilloscope may be operated from either a 100 V to 240 V, 50/60 Hz power source. Use the following procedure to change from 100- to 240 volt operation or vice versa.

1. Remove the fuse holder.
2. Replace fuse F 1 with a fuse of appropriate value, 1 amp for 100 VAC to 120 VAC operation, 0.7 amp for 220 VAC to 240 VAC operation.
3. Reinsert it for appropriate voltage range.
4. When performing the reinsertion of fuse holder for the voltage conversion the appropriate power cord should be used. (See Fig. 1.)

# CIRCUIT DESCRIPTION

## 1. VERTICAL PREAMPLIFIER CIRCUIT (X73-1650)

The signals from the input BNC of channel 1 and channel 2 are attenuated to a suitable value by 1st ATT, Q1, Q2, and Q69 of the head amplifier (Q9, Q10, and Q70 for channel 2), and 2nd ATT, and are then sent to U2a-e, Q3 and Q4 of the 1st preamp. DC feedback is applied to the head amplifiers from the op amp in order to reduce DC balance drift. The 1st preamp is a selectable gain type amplifier. When the range is set to 1 mV/div or 2 mV/div, the gain of the 1st preamp becomes 5 times the normal gain. Also, an adequate CMRR is obtained.

The signals from the 1st preamp pass through the emitter follower consisting of Q65 and Q66, then enter the 2nd preamplifier-cum-vertical mode switch consisting of Q5-Q8. Here, the CH1 ~ CH3 signals are switched by the V-MODE switch, and then sent to the delay line driver. Like the CH1 signals, the CH2 signals pass through the head amplifier, U4a-e, and Q11-Q14 of the 1st preamplifier, Q67 and Q68 of the emitter follower, and Q15-Q18 of the 2nd preamplifier. Q11 and Q14 are for CH2 INV, and are not provided in channel 1.

The input sensitivity of channel 3 is 0.5 V/div which is low compared with that of the other channels, hence 1/10 ATT is provided at the input. The signals which are attenuated by ATT pass through Q19, Q20, Q22, and Q23 of the head amplifier, then enter Q24-Q27 of the mode selector which is equivalent to the 2nd preamplifier of channel 1 and channel 2.

The delay line driver consists of Q30-Q33. Of these, Q32 and Q33 are connected in cascode with the based-grounded transistors Q1 and Q2 in the first stage of the vertical final amplifier. The delay line is inserted between the collector and emitter of this cascode amplifier.

## 2. TRIGGER SIGNAL SWITCHING CIRCUIT (X73-1650)

The trigger signals which are output differentially from each channel enter Q36-Q40, Q45-Q49, and Q52-Q56 of the respective trigger switching circuits. The line trigger signals from the power supply circuit enter the trigger switching circuit consisting of Q57-Q59.

The four trigger signals (Channel 1 to Channel 3, and LINE) pass through Q57-Q60, and are selected in accordance with the switching signals from the horizontal sweep unit. They then pass through the trigger output amplifier consisting of Q60 and Q61, and are sent from P10 to the horizontal sweep unit.

The signals from CH1 OUT are branched from the trigger switching circuit of channel 1, then pass through Q42, Q43, Q71, and Q44 of the output circuit, and are output from P17.

## 3. VERTICAL FINAL AMPLIFIER (X73-1660)

The signals which pass through the delay line are terminated by Q1 and Q2, and then amplified by Q3-Q6 of the cascode amplifier in the next stage.

The signals which have been converted to low impedance by the emitter follower of Q7 and Q8 are amplified to the 2.3 V/div (one side) deflection sensitivity of the CRT by Q9-Q14 of the final stage amplifier.

U1 is a servo circuit which is designed to regulate the operating point of the final stage amplifier. By means of this circuit, the deflection plates are maintained at a constant average voltage.

## 4. POWER SUPPLY CIRCUIT (X73-1660)

The power supply provides five regulated voltages, two unregulated voltages, and also one scale illumination output.

When the power switch is turned ON, first +10 V is provided by Q22 and U2a, and -10 V is provided by Q21 and U2b. The 5 V, 55 V, and 120 V outputs are regulated with reference to this -10 V.

Q26 and Q27 are ripple filters which are used for the unregulated +12 V and -12 V voltages.

The voltage for the scale illumination lamp is rectified by D6 and controlled by Q24.

## 5. TRACE ROTATION AND CAL CIRCUIT (X73-1660)

The trace rotation circuit is consisted of emitter follower of Q23 and Q25. It drives the rotator coil which is located on the cone of the CRT. The CAL circuit is an oscillator circuit consisting of the op amp U3b. It generates 1 kHz square wave which is switched by Q20 to become a 1 Vp-p CAL signal.

## 6. BLANKING CIRCUIT AND HIGH VOLTAGE CIRCUIT (X68-1460)

The unblanking signals from P11 are inverted and amplified by the blanking amplifier consisting of Q3-Q5, and are then superimposed on the cathode voltage by the DC recovery circuit consisting of D8-D10.

Q1 and Q2 constitutes an inverted amplifier for auto-focusing. It creates the focusing voltage from the blanking signals. The focusing voltage is superimposed on the high voltage by the DC recovery circuit consisting of D4-D6, and then used to drive the focusing electrode. The -1.5 kV high voltage for the cathode is generated by the converter oscillation circuit consisting of U1, Q6 and Q7, and also the high voltage converter block (W02-0423-05). Negative feedback is applied to the converter oscillation circuit from the cathode in order to obtain a regulated high voltage.

# CIRCUIT DESCRIPTION

## 7. TRIGGER CIRCUIT (X74-1440)

The trigger signals sent from the vertical system pass through P10 then enter the trigger amplifier consisting of Q1-Q3, Q6, and Q7, where they are amplified to operate the ECL logic. Q4, Q8, and U1a constitute the trigger level setting circuit which is used for FIX synchronization. This circuit detects the peak-to-peak value of the signal, and takes it off as a center point voltage.

Q9 is a sync separator circuit which is used for TV synchronization. It clamps the sync tip and extracts the sync pulses. These pulses are then passed through an integrating circuit consisting of R39 and C19 in order to obtain the vertical sync pulses.

The signals which leave the trigger amplifier are wave-shaped by the Schmitt trigger circuit consisting of U4a and b, and the trigger slope is selected by U4c. These signals and the previously mentioned TV sync pulses drive the subsequent horizontal sweep circuit.

## 8. HORIZONTAL SWEEP CIRCUIT (X74-1440)

When the trigger pulses trigger flip-flop U6, the output will be inverted, and the Miller integrator circuit, which consists of Q16, Q17 and a group of RC circuits that can be selected by a rotary switch, starts the sweep. The sweep signal is output for an interval (sweep length) determined by the comparator consisting of Q20 and Q21, and the RS flip-flop consisting of U5a and U10b, then after a rest period determined by the hold-off circuit consisting of Q22, the flip-flop waits for the next trigger signal.

The B sweep takes place when flip-flop U6 is switched after a delay which is determined by the comparator consisting of Q32-Q34 and the voltage from the potentiometer. The sweep signal is generated by the Miller integrating circuit for B sweep consisting of Q28 and Q29.

The A sweep and B sweep signals are switched by Q67, Q37, Q40, and Q41 of the sweep switching circuit, and are sent to the horizontal final amplifier consisting of Q43-Q52.

## 9. CHANNEL SWITCHING SIGNAL GENERATOR CIRCUIT (X14-1440)

This is a timing generator circuit which is designed to turn each channel ON-OFF for DUAL and TRIPLE operation. U13c and d are CHOP generators for CHOP operation, and U11a and b are frequency divider circuits for DUAL or TRIPLE operation. The clock used for the frequency divider circuits for ALT operation is A blanking, and that used for CHOP operation is the AND signal resulting from A blanking and the output of the CHOP generator.

During V-MODE operation, the channel switching signal becomes the trigger selector signal. In all other cases, only the necessary trigger signal can be selected.

## 10. UNBLANKING SIGNAL GENERATOR CIRCUIT (X74-1440)

The unblanking signal is formed by the switching of A blanking and B blanking in each sweep mode. It is output from the emitter of Q68 superimposed on the intensity voltage.

# ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.

The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available, contact your dealer. For optimum adjustment, turn the power on and warm up the scope sufficiently (more than 30 minutes) before starting.

Before calibrating the scope, check the power supply voltage.
