SAFETY

SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. The specified voltage is shown at the left side of the power cord on the rear panel. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the oscilloscope at earth ground. Do not attempt to defeat the ground wire connection or float the oscilloscope; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

The optional power cords are shown as follows in Fig. 4.

Line fuse

The fuse holder is located on the rear panel and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

Voltage conversion

This oscilloscope may be operated from either a 100 V to 240 V, 50/60 Hz power source. Use the following procedure to change from 100- to 240 volt operation or vice versa.

1. Remove the top section of case.
2. Unplug the leadwire of the voltage selector P37 located on the connection unit (X77-1300).
3. Reinsert it for appropriate voltage range.
4. Replace fuse F 1 with a fuse of appropriate value, 2 amp for 100 VAC to 120 VAC operation, 1 amp for 220 VAC to 240 VAC operation.
5. When performing the reinsertion of leadwire for the voltage conversion the appropriate power cord should be used. (See Fig. 4.)

CIRCUIT DESCRIPTION

VERTICAL ATTENUATOR UNIT

The CS-1060/1040's attenuator unit includes attenuators, $\times 5$ amplifier, and preamplifier. First attenuator immediately comes after the AC-GND-DC selector switch and second attenuator follows impedance conversion. First attenuator provides attenuations of 1/1, 1/10, and 1/100, and the second of 1/1, 1/2, and 1/5. In impedance conversion, the input signal is separated into high- and low-frequency components and the high-frequency components are converted by Q3 and the low-frequency are converted by U1.

The $\times 5$ amplifier comprises U2c/d and Q7, 8, operating only when the 1 mV/div and 2 mV/div ranges are selected. The preamplifier comprises U2a/b and Q9, 10 and amplifies the output signal of the attenuator, supplying the resulting signal to the preamplifier unit. In this stage, VARIABLE ATT (VR5, 6) permits to vary gain continuously.

VERTICAL PREAMPLIFIER UNIT

The vertical preamplifier unit comprises three preamplifiers which amplify signals channel 1 and channel 2 coming from the attenuator unit and signal channel 3 coming from the sweep unit; vertical mode selector which switches the signals; and the output amplifier which delivers the selected signal to the vertical final amp unit.

The preamplifier of channel 1 comprises Q1, 2 of the POSITION circuit and Q3-5, Q12 and Q13 of the cascode amplifier. The signals developing at the emitters of Q3 and Q4 pass through emitter followers Q6 and Q7 before getting output as signal channel 1 trigger signal via Q8 and as channel 1 output signal via the channel 1 output circuit of Q9-11 and D3.

Similarly, the preamplifier of channel 2 comprises Q21, 22 of the POSITION circuit and Q23-25 and Q30-32 of the cascode amplifier which is provided with the capability of CH2 INV. The signals developing at the emitters of Q23 and Q24 pass through Q26-29 before getting output as X-Y and channel 2 trigger signals.

The vertical mode selector switches channels by driving Q47-49 according to the Enable signal supplied from the vertical mode logic of the trigger unit. The selected signal passes emitter followers Q61, 62 and go out through the output amplifier of Q64-67. The output amplifier includes U2 and Q63 which keep the operating level of Q61, 62 fixed and the vertical mode trigger output circuit comprising Q68, 69 and D31, 32.

Preamplifier of channel 3 comprises Q41-46 of cascode amplifier.

VERTICAL FINAL AMPLIFIER

The vertical signal comes from the vertical preamplifier to the final amplifier via a delay line. The final amplifier comprises grounded-base Q1, 2 and two stages of cascode amplifiers, Q3-6 and Q7-10. The output of the amplifier is connected to the Y-deflection plate of the CRT. The final

amplifier also includes U1 and D1, 2 which keep the operating level fixed, eliminating adjustment.

VERTICAL MODE LOGIC

The vertical-MODE switch signal and the horizontal display signal both enter the vertical mode logic, one from the vertical preamplifier unit and the other from the sweep unit. The logic comprises U8c/d, U5a, and D18 of the chop signal generator; U3b and U5b of the divider during horizontal display ALT mode; and U4, U6, U7a/b/d, and U8b generating the Enable signal, and controls vertical mode.

TRIGGER SIGNAL GENERATOR

Output trigger signals of channel 1, channel 2 and vertical mode coming from the vertical preamplifier unit and channel 3 and line coming from the sweep unit, one is selected by the trigger source selection circuit comprising S1, Q1-3, and D1-6 and again by the trigger coupling selection circuit comprising S2a/b and Q4-6. For ordinary signal, the trigger amplifier of Q16-19 amplifies the selected trigger signal, the Schmitt circuit of U11a/b shapes its waveform, and U11c selects SLOPE. the trigger level is controlled by varying the base level of Q17, with U9b and Q7 driven by the signal supplied from VR7a. At FIX, the outputs of Q9 and D12, 13 determine the level.

For video signal, on the other hand, the video synchronization circuit comprising Q10-15, Q59, U9a, D7, 8, D11, and D14 separates the sync signals which are output as trigger signals after U12b has shaped the waveform. The trigger signal, selected by U12a/c/d, is delivered to the sweep unit.

BLANKING CIRCUIT

The A-blanking and B-blanking signals coming from the sweep unit enter the blanking control circuit via Q20, 21 and Q58. The blanking control circuit comprises U1a/c, U2a/b/c, U3a, U5c/d, U7c and U8a. The logic signal formed of the HORIZ DISPLAY switch and blanking signals drives Q22-24 to control the collector current of Q26 and generate the output signal to the blanking amplifier.

U1d, U2c, Q29-32, and Q57 form the trace separation circuit which controls the vertical position of B-sweep when selected HORIZ DISPLAY switch to ALT.

The input signal to the blanking amplifier varies also with INTENSITY control and the outputs of Q25 and of the external intensity modulation circuit comprising Q28 and D19, 20. The blanking amplifier consists of Q27 and Q33-40. The amplified signal is, after added with a high dc voltage by the dc regenerating circuit of D31-36, sent to the CRT as the auto-focus and intensity signals. The dc-dc converter is formed of Q51, 52, Q55, 56, and U10b.

CIRCUIT DESCRIPTION

CHANNEL 3 ATTENUATOR CIRCUIT

The channel 3 input terminal is common to the input of external trigger signal. The input signal enters the amplifier of Q1-5, Q34, and U8 via the channel 3 attenuator which selects either 0.1 V/div or 1 V/div. Channel 3 position control varied by detecting the dc signal coming from the trigger unit with U8 and driving the base of Q4. The outputs of differential amplifiers Q4-5 are delivered respectively to the trigger source selecting circuit and the channel 3 preamplifier as the channel 3 trigger signal and the channel 3 signal.

HORIZONTAL SWEEP CIRCUIT

The trigger pulse comes from the trigger control unit to the A sweep logic circuit of U1a, U2a/b, U3a, and U5a/b and to the B sweep logic circuit of U1b, U3c/d, U4, and U6. To the A/B sweep logic circuit, signals come from the holdoff circuit comprising U5c, Q16, 17, Q35, 36, and D10, the delay time generator of Q19, 20 and Q22, and the auto-free-run circuit of U2c/d, U3b, and U5d. These signals, together with the signals of trigger mode and the horizontal display logic, time the generation of the sawtooth waves which are supplied to the A/B sweep sawtooth wave generators.

The A sweep sawtooth wave generator comprises Q6-8, Q37, Q41, D4, sweep rotary switch, and R-C providing time constants out of which the rotary switch selects one. When H (high) comes from the A sweep logic, Q6 turns off and its collector voltage falls. Then Q41 turns off, the gate voltage of Q7 falls, and Q7, 8 turn off. As a result, the capacitor selected with the sweep rotary switch begins to get charged, with a sawtooth wave generated. When the voltage across the capacitor rises to a certain level, the sweep stop circuit of Q9, 10 inverts flip-flop U5a/b to stop sweep.

B sweep is performed similarly. The sawtooth wave generator of Q11-13, Q38, and Q42, the sweep stop circuit of Q14, 15 and flip-flop U6a/b cooperate to generate a sawtooth wave.

U7b/c is a flip-flop working for single sweep (sweep will be performed only once after getting reset). U7a and Q33 drive the READY LED.

A/B-SWEEP AND X-Y SELECTION CIRCUIT

The A/B sweep and X-Y selection circuits, comprising Q18, Q23-28, Q40, and D11, switches the sawtooth waves generated by the A/B sweep sawtooth wave generators and the X signal of the channel 2 preamplifier. During A sweep, D11 turns off according to signal QB and Q23 turns on so that the sawtooth wave of A sweep is output from emitter follower Q26. During B sweep (or X-Y) mode, Q18 and Q40 turns off and signal comes from Q24 and Q25. Q27 controls the emitter currents of Q23 and Q24 to move horizontal position.

HORIZONTAL FINAL AMPLIFIER UNIT

The horizontal signal comes from the A/B sweep and X-Y selection circuits to the horizontal final amplifier comprising Q41-50, which amplifies the signal before applying to the X deflection plate of the CRT. Q43, 44 are FET switches which are on during $\times 10$ MAG mode to raise gain to ten times.

HIGH-VOLTAGE BLOCK

(*applies to the CS-1040.)

The acceleration voltage of the CRT is 16 kV (*12 kV). The converter transformer and the high-voltage rectification circuit are contained in the high-voltage block sealed with resin for safety. The outputs of the high-voltage block are -1.75 kV dc (applied to the cathode), 6.3 V ac (for the CRT's heater), and 14 kV (*10.5 kV) (applied to the anode for acceleration).

PROBE CALIBRATION VOLTAGE GENERATOR

The probe calibration voltage generator is mounted on the connection unit and comprises U1a and D1-3.

The trace rotation circuit, also mounted on the connection unit, drives the rotation coil to vary the declination of the trace according to the outputs of Q1, 2.

POWER SUPPLY

The voltage regulator generates varying voltages with reference to -15 V. D21 provides the reference voltage. Operational amplifier U9a compares voltages. And Q2 regulates the -20 V which D14 provides to generate -15 V.

For +5 V, a voltage divided from -15 V with resistors is applied to U10b, which drives Q4 to regulate the +9 V provided by D15. Similarly, +15 V, +50 V, and +120 V are obtained by regulating the voltages which D14, D17, and D16 have rectified respectively with U9b and Q3; U10a, Q31, and Q5; and U11, Q32, and Q6.

ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.

The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available, contact your dealer. For optimum adjustment, turn the power on and warm up the scope sufficiently (more than 30 minutes) before starting.

Before calibrating the scope, check the power supply voltage.
