

# MS-1650

# MU-1651

 **TRIO**

<Note>

**Differences of the MS-1650, MS-1650A, and MS-1650B**

★ Function

The MS-1650A is the MS-1650 plus FREE RUN function. The MS-1650B is basically the MS-1650A quad-trace digital memory scope plus FREEZE function. 1 MHz fixed read out function, expanded memory position range, control signal output lines for the MU-1651, and memory waveform input connectors (BNC type) from the MU-1651. Its memory is backed up with big capacitor and, therefore, no battery compartment is provided for.

★ Circuity

The MS-1650A is the MS-1650 plus the FREE RUN unit (X77-1230-00). The MS-1650B is the MS-1650A plus the VERTICAL SUB UNIT (X73-1470-00) and HORIZONTAL SUB UNIT (X74-1330-00) units.

## CATHODE RAY TUBE

### Type

E2713B31A

### Acceleration voltage

Approx. 2 kV

### Display area

8 div × 10 div (1 div = 9.5 mm)

## VERTICAL AXIS

### Sensitivity

10 mV/div — 20 V/div, ± 5%

### Attenuator

10 mV/div — 20 V/div, 1-2-5 sequence

11 ranges, fully adjustable

### Input impedance

1 MΩ, ± 5% 26 pF ± 3 pF [22 pF ± 4 pF]

### Frequency response

Oscilloscope DC: DC-10 MHz (-3 dB)  
AC: 2 Hz-10 MHz (-3 dB)

Digital memory DC: DC-250 kHz (-3 dB)  
AC: 2 Hz-250 kHz (-3 dB)

### Rise time

35 ns (Oscilloscope operation)

### Maximum input voltage

600 Vp-p or 300 V (DC + AC peak, at 1 kHz)

### Operating mode

REAL: Oscilloscope operation or memory free-run

DUAL: Real time and memory waveforms, dual trace  
operation (CHOP mode of approx. 500 kHz)

MEMORY: Memory waveform readout

X-Y: X-Y scope operation

## A/D CONVERTER

### Resolution

8 bits

### Conversion system

Successive Approximation type A/D converter

### Scale-over

8 div vertical scale

## SWEEP CIRCUIT

### Sweep system

Trigger sweep (NORM), auto sweep (AUTO)

### Sweep time

1 μs/div — 1 s/div, ± 5%

1-2-5 sequence

19 ranges, fully adjustable

### Magnifier

X5 MAG ± 10%

### Linearity

Less than 3% (5 μs/div — 1 s/div)

Less than 5% (1 μs/div — 2 μs/div)

## SYNC CIRCUIT

### Sync input

INT: Vertical input signal

LINE: Line frequency

EXT: EXT TRIG input signal

### Polarity

Positive or negative

### Sync voltage

INT: More than 1 div of amplitude on the CRT

LINE: Within the specified power supply voltage

EXT: More than 1 Vp-p

### Sync frequency

INT: 20 Hz — 10 MHz

EXT: DC — 10 MHz

### External sync input voltage

± 15 V (DC + AC peak) [20 V (DC + AC peak)]

## HORIZONTAL AXIS

### Operating system

DISPLAY MODE selector switch to X-Y position

### Sensitivity

150 mV/div (± 20%, HOR. GAIN MAX)

### Frequency response

DC: DC—1 MHz (-3 dB) (HOR. GAIN MAX)

### Input impedance

100 kΩ ± 20%, 35 pF or less

### Maximum input voltage

50 V (DC + AC peak, HOR. GAIN MAX)

## MEMORY UNIT

### Memory capacity

1024 words (100 words/div)

### Write speed

0.1 ms/div — 1 s/div, 13 ranges (equivalent to

1 μs/word — 10 ms/word)

EXT (MS-1650B only):

Rising edge of EXT CLOCK input signal.

Repetition rate frequency: Less than 500 kHz

High level pulse width: Not less than 1 μs

Low level pulse width: Not less than 500 ns

Rise time: Not less than 500 ns

### Readout speed

SCOPE: Same as write speed

Fixed read out. (at 1 μs/word for DISPLAY TIME  
pulled position).

PEN: 10 ms/word, 20 ms/word 50 ms/word, 3 ranges  
(Switchable to 100 ms/word, 200 ms/word,  
500 ms/ word by changing jumper wire connec-  
tion on the P.C. Board).

EXT: Rising edge of EXT CLOCK input signal.

Repetition rate frequency: Less than 1 MHz

Input signal:

High level pulse width: Not less than 1 μs

Low level pulse width: Not less than 500 ns

Rise time, Not less than 500 ns

# SPECIFICATIONS: MS-1650B

**Input voltage:** TTL level  
**Maximum input voltage:** 20 V (DC + AC peak)  
**Input resistance:** Approx. 30 kΩ

## Delay

— DELAY (0—9 div, DIG SW setting)

## SIGNAL OUTPUT

### Display time

The amount of time for which memory signals are displayed can be varied from approx. 1 to approx. 20 seconds.

### Memory out and Memory out for pen (Output only in PEN mode)

#### Display time

Output wave: Memory wave  
Output voltage: 1.6 Vp-p, full scale (at 8 div)  
Output resistance: Approx. 430 Ω [approx. 470 Ω]

#### Read gate

Output wave: Positive pulse (1 word) of final address  
Output voltage: TTL level  
Output resistance: Approx. 220 Ω

#### Read gate for pen (Output only in PEN mode)

Output voltage: TTL level (LOW active)  
Output resistance: 220 Ω

#### Sweep gate

Output wave: Positive pulse coincident with sweep signal  
Output voltage: TTL level  
Output resistance: Approx. 220 Ω

#### CAL (Calibrating voltage)

Output wave: 1 kHz, ±10%, square wave  
Output voltage: 1 Vp-p ±5%

#### Data out

Data output:  
8 bit binary parallel output, positive output (TTL level)

#### Timing pulse:

Positive and negative outputs (TTL level)

#### Read gate out:

Positive output of the final-address one word  
Output resistance: Approx. 220 Ω (TTL level)

#### Ext. clock:

TTL level clock input of 1 MHz or below  
High level pulse width: Not less than 1 μs  
Low level pulse width: Not less than 500 ns  
Rise time: Not more than 500 ns  
Input resistance: Approx. 30 kΩ

## MEMORY SIGNAL INPUT (MS-1650B only)

3 inputs for MU-1651(T), MU-1652(T)

**Sensitivity:** 1.6 Vp-p, full scale  
(200 mV/div)

**Frequency response:** DC— approx. 1 MHz  
(-3 dB), Smoother; off  
DC— approx. 150 kHz  
(-3 dB), Smoother; on

**Input impedance:** Approx. 60 kΩ

**Maximum input voltage:** 20 Vp-p or 10 V (DC + AC peak)

## INTENSITY MODULATION

### Input voltage

TTL level (Intensity increasing with more positive levels)

### Input impedance

Approx. 15 kΩ

### Input frequency

DC — 1 MHz

### Maximum input voltage

50 V (DC + AC peak)

## POWER REQUIREMENT

**Voltage** 100/120/220/240 V, ±10%, 50/60 Hz

**Power consumption** Approx. 60 W [approx. 50 W]

## DIMENSIONS

**Width** 284 mm (328 mm)

**Height** 138 mm (153 mm)

**Depth** 400 mm (463 mm)

( ) dimensions include protrusions from basic case outline dimensions

**Weight** Approx. 9 kg

## OPERATING TEMPERATURE

Operating temperature for guaranteed specification:

0° ~ 40°C

Full operating temperature: 0° ~ 50°C

## ACCESSORY

Probe (PC-22) .....	1 piece
Attenuation.....	1/10

## OPTION (MS-1650B only)

Joiner CZ-84

# CIRCUIT DESCRIPTION; MS-1650B

## VERTICAL AMPLIFIER UNIT (X73-1370-02)

The vertical signal input via the BNC connector is applied to the first ATT via the AC-GND-DC switch which is selected as required. The ATT output signal is applied to the dual FETs (IC201), which has a high input impedance. (Use of dual FETs ensures stable DC balance under varying temperature conditions.) The signal is then applied to emitter followers Q204 and Q205, which have a low output impedance and are connected to the second ATT. The second ATT varies the degree of amplification by changing the emitter resistances of Q206 and Q207. DC balance of the source follower at the first stage of the second ATT is obtained with VR201. The vertical signal is then applied to the variable amplifier consisting of Q208 and Q209, where the signal level is adjusted. VR203 adjusts the DC balance of the variable amplifier so that the trace does not shift when the VR is turned. VR1a varies the DC level balance between the collectors of Q208 and Q209 to adjust vertical positioning of the waveform on the CRT. The vertical signal is then applied to both the mode selection circuit and the buffer amplifier stage of the A/D converter.

The mode selection circuit consists of IC203, IC205 and IC206. IC203 operates as a mode selection switch, IC205 passes the input signal and IC206 passes the memory signal. Q216 and Q217 form a cascode amplifier which amplifies the signal to a sufficient level. The signal is then amplified by the output amplifier consisting of Q220 through Q227. Finally, the vertical signal is applied to the vertical deflection plates of the CRT.

VR205 and VR206, connected to pins 1 and 13 of IC205 and 206, respectively, adjust their gain. The memory signal is amplified by IC204 after it is subjected to D/A conversion, and is then applied to IC206. Vertical positioning of the memory signal waveform is adjusted with VR16, which is connected to IC204.

The D/A buffer amplifier output signal applied to the cascode amplifier consisting of Q210 through Q213, its level is shifted by zener diodes D204 and D205. The signal is then applied to IC202, which has single ended output. The IC202 output signal is applied to the D/A input terminal of the control section. The signal from the emitter of Q214 is interconnected with the horizontal circuits and is used as the sync signal.

## VERTICAL SUB UNIT (X73-1470-00)

Logic signals from the UNIT SELECT and DISPLAY MODE switches of MEMORY UNIT (MU-1651, 1652) are converted to a 2-bit signal by IC802 and IC803.

IC801 selects MEMORY OUT signals from, MAIN and MEMORY UNIT 1, 2, and 3 according to the 2-bit signal. Q801, RY1, and RY2 controls attenuation for the output signal of IC801.

Q802 and Q803 are switches of the circuit which interpolate between sampling points of Q801's output. The

rear-panel SMOOTHING switch turns on and off Q802 and Q803.

When the MU-1651 is connected, a switching signal comes from it to IC802 and IC803. IC801 and Q801 selects either the memory signal output from IC201 of the MS-1650B's vertical amplifier or the memory signal entered from the MU-1651 to MEMORY SIGNAL IN 1, 2 and 3, and delivers the signal selected to IC203 of the vertical amplifier. IC804, RY1, and RY2 select attenuations 1/1, 1/2 and 1/4. When the MU-1651 is not connected, only the memory signal comes into IC203.

## HORIZONTAL UNIT (X74-1240-02)

The trigger signal selected with the SOURCE switch (INT/LINE/EXT) is applied to differential amplifier IC401. The rising or falling edge of the waveform is used to determine the sweep starting point. The edge used is selected with the SLOPE switch. Variable resistor VR4 varies the DC level of the trigger signal to shift the sweep starting point. The trigger signal, after selection with the SLOPE switch, is applied to a Schmitt trigger circuit consisting of gate circuits in IC403 through emitter follower Q402. The waveform of the trigger signal is shaped into a square wave which is used as the clock pulse signal for sweep control flip-flop IC404. The flip-flop inverts its state according to the clock pulse signal to turn Q403 OFF, then the Miller integrator starts charging.

The Miller integrator determines the sweep time according to the time constant of C and R, which is selected with the SWEEP TIME/DIV selector. It produces a saw-tooth waveform with good linearity. The state of hold-off timer IC405 is inverted when the Miller integrator output level at Q413 rises. Therefore, sweep is stopped for the time determined by the hold-off time constant. After the hold-off time has been passed, the next clock pulse is waited.

When the TRIG AUTO switch is ON, the trigger signal output from the Schmitt trigger drives the automatic sweep circuit, which consists of Q406 through Q408. The collector level of Q408 is LOW and the flip-flop is in the free running state when adequate trigger signal is absent. The flip-flop is synchronized with the clock signal when the trigger signal is input.

The saw-tooth wave generated with the Miller integrator is applied to the horizontal amplifier, which consists of Q416 through Q421, via the SWEEP/EXT H selector IC407, and its signal level is amplified to the desired level. Then, the saw-tooth wave signal is applied to the horizontal deflection plates of the CRT.

When the DISPLAY MODE switch is set at EXT-H, the SWEEP/EXT H switch switches from the Miller integrator to the buffer amplifier and connects to horizontal output amp. The sweep circuit stops if the DISPLAY TIME switch is in the pushed position at this time. The signal coming from the vertical amplifier enters the Y-input. When the

# CIRCUIT DESCRIPTION

DISPLAY TIME switch is pulled, the sweep circuit operates and the MEMORY OUT signal comes to the Y-input. And memory read-out clock is fixed to  $1 \mu\text{s}/\text{word}$  rather than determined with the SWEEP TIME/DIV rotary switch.

## MEMORY SIGNAL FIXED READ OUT CIRCUIT

If DISPLAY TIME is pulled during observation of memory waveforms, SWEEP TIME/DIV is electrically fixed at 0.1 msec/div. Normally, Q708 is on and Q706, Q704, and Q703 operate. During fixed read out, Q707 is on with Q705, Q702, and Q701 operating to sweep. D704, D705, and IC702 work to stop sweeping during X-Y operation at REAL mode.

## HORIZONTAL SUB unit

Part of the Miller integrator of the horizontal sweep circuit is installed in this units and is switched with READ/WRITE signal for fixed read out operation.

## DIGITAL MEMORY CIRCUIT

The vertical input signal applied to the A/D converter from the A/D buffer amplifier is converted into a digital signal. The A/D converter circuit consists of the following circuits: analog comparator IC530, which compares the A/D converter input signal with the D/A converter output signal; sequential comparison register IC529, which compares and latches MSB through LSB of the analog comparator output in that order, and D/A converter consisting of Q507-Q514. The A/D converter output is latched by register IC578 each time one word is converted. The sampling speed is determined by the A/D start signal supplied by the time base unit.

The time base unit consists of a crystal controlled oscillator (IC541), which generates 10 MHz, and a frequency divider (IC553, IC564, IC563, IC552, IC551, IC540 and IC539). The frequency dividing ratio is determined by the SWEEP TIME/DIV switch. When the CLOCK switch is set in the INT position in the SCOPE mode, a clock signal with a period of 1/100 of the period specified by the SWEEP TIME/DIV switch is output from pin 8 of IC538. When the CLOCK switch is in the INT position and in the PEN mode, a clock signal with a period of 10, 20 or 50 ms (according to the setting of the PEN SPEED switch) is output from pin 11 of IC538. When the CLOCK switch is in the EXT position, the clock signal input to the EXT CLOCK terminal is output from pin 12 of IC549. However, when the SWEEP TIME/DIV switch is set in the range from  $1 \mu\text{s}$  through  $50 \mu\text{s}$ , the frequency divider stops operation so that the A/D converter does not operate.

The clock signal generated by the time base unit is applied to the address counter (IC526, IC519 and IC511) and the delay counter (IC533, IC532 and IC531) to write the data into memory (IC574 and IC575) in sequence when the

WRITE START switch is depressed to ON. When a trigger pulse comes in, the delay counter starts counting by the number which is the complement of the number set by the digital switch of TRIGGER POINT until the member of the end which is 1024 and stop writing into memory. A latch circuit (IC503 and IC502) stores the initial point number. Memory read out starts in synchronization with the SWEEP GATE signal after memory write has been completed. Memory output data are latched by IC573, then applied to a D/A converter consisting of Q515 through Q522 so that it is converted into an analog signal. The analog signal is applied to a voltage follower consisting of IC501 and IC580 (FOR PEN), then is applied to the memory amplifier in the vertical amplifier and to the MEMORY OUT terminal. IC584 is a buffer used to deliver control signals to the MU-1651 and it is connected to CONTROL OUT.

## FREE RUN CIRCUIT

S1a,b (X77-1230-01) switches between the normal and free run modes.

The free run mode is selected by pulling the S1a,b knob out. In the free run mode, the ground level is applied to one input terminal of IC2 via diode D1 and the R/W C signal is applied to the other input terminal of IC2. When the R/W C signal becomes low during its READ period, the gate output level also becomes low; therefore, the timer (IC1) is triggered. This ground level signal from the gate circuit is applied to pin 2 (the clear terminal) of IC203 in the vertical amplifier and pin 2 (the clear terminal) of IC404 in the horizontal amplifier through diodes D2 and D3, respectively. The timer (IC1) holds pin 2 at the high level for the time determined by VR1. When pin 2 of IC1 drops to the low level, pin 6 of IC555 in the control unit is set to the low level through diode D1 so that the write state is entered (i.e., the R/W C signal level is high). After memory write has been finished, the gate of IC2 described above outputs a GND level signal again to trigger the timer. The above process is repeated automatically.

## CRT POWER SUPPLY CIRCUIT

The CRT (Cathode Ray Tube) requires a voltage of about 2 kV. This high voltage is generated using a DC-DC converter, and is regulated by a feedback-type voltage regulator. A negative feedback amplifier and a DC reproducing circuit are used to prevent the high voltage from varying when the brightness is increased and to improve the unblanking characteristics during high speed sweep.

All the power supply circuits use voltage regulators; the main power supply circuit uses a tracking generator, so it is particularly stable.

# MS-1650B BLOCK DIAGRAM

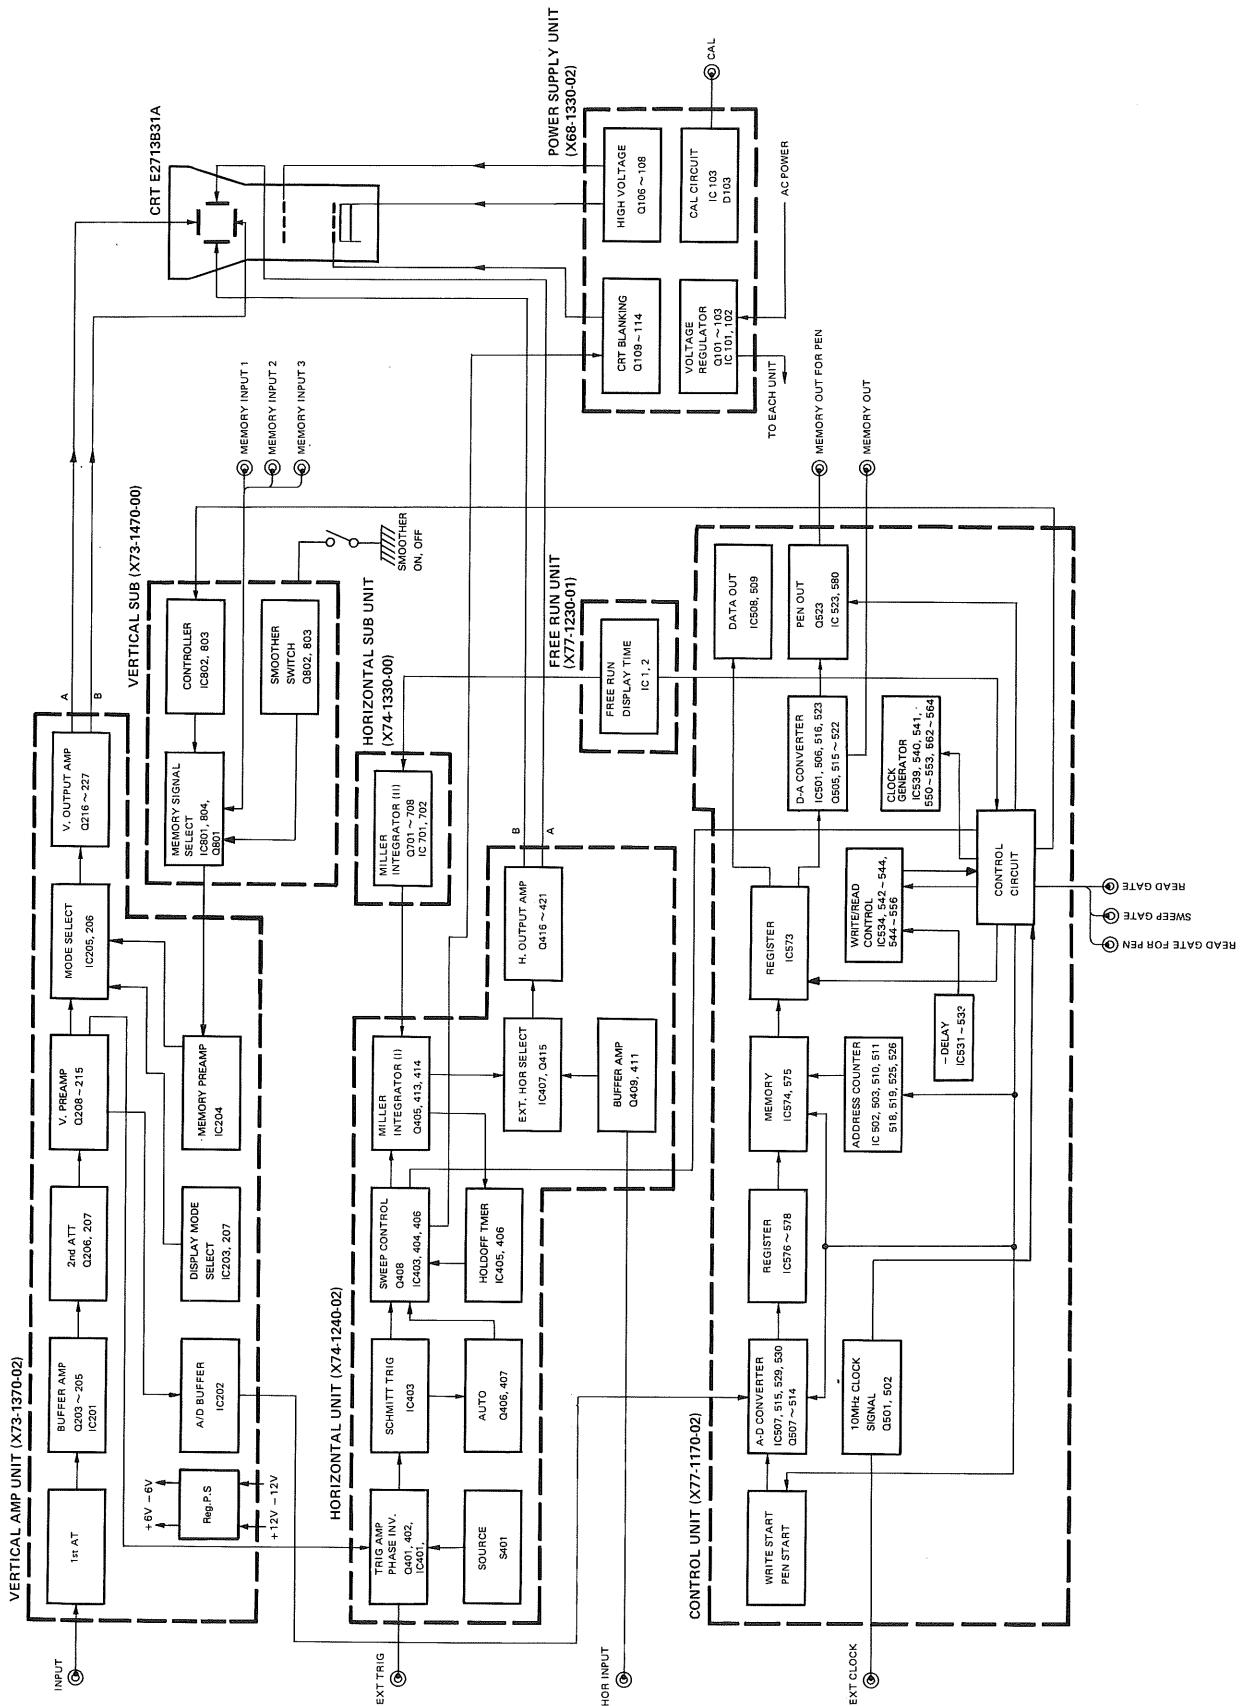

Fig. 1

# CIRCUIT DESCRIPTION; MS-1650B

ABBREVIATIONS			PRES	PEN RESET
MCLK1	10MHz CLOCK	CLK		PEN SCOPE signal develops at IC559 pin 3 and one-shot pulse goes out. When PEN MODE is entered with PEN-SCOPE SW depressed, this state gets reset with initial address by PEN LOAD and PEN OUT output changed to saturation level.
PEN	PUSH PEN-SCOPE SW	READ MODE (RMD)		
FRZ	PUSH FREEZE	RMD		
SCOPE	PEN-SCOPE SW	RMD	PSTP	PEN STOP
WR CLK	CLOCK for WRITE & READ	CLK		This signal is used to stop pen action and is a signal developed (at IC569 pin 11) when ADDRESS reaches 1024 is utilized.
WSTS	PUSH WRITE START SIGNAL	WRITE MODE (WMD)		
PSTS	PUSH PEN START SIGNAL	WMD	PLD	LOAD FOR PEN LOAD signal for PEN.
SWP	SWEET SIGNAL from IC 404-6 pin	WMD		The first address enters ADDRESS COUNTER.
W R	WRITE MODE or READ MODE SIGNAL	WMD	CHAT	Retaining signal while PEN-SCOPE SW is OPEN.
LAS	DECISION LAST (FIRST) ADDRESS	WMD		Signal output during READ MODE.
PWRES	POWER ON RESET	WMD	READ	LOAD FOR READ MODE
CSP	COUNT DOWN STOP PULSE (CARRY)	WMD	RLD	By SWEET SIGNAL during READ MODE.
CUP	COUNT UP PULSE (BORROW)	WMD	PCLK	PEN CLOCK READ CLOCK during PEN MODE.
WSP	WRITE STOP PULSE 390 $\Omega \times$ 1000P ( $\mu$ sec)	WMD	RCLK	READ CLOCK READ CLOCK during READ MODE.
WP	WRITE PULSE	WMD	W CLK	WRITE CLOCK
WRS	WRITE RESET	WMD		WRITE CLOCK during WRITE MODE.
PSP	STOP PEN		R CLK	READ CLOCK
WST	WRITE START			READ CLOCK during READ MODE.
PST	PEN START		LOAD	LOADs the first address of ADDRESS COUNT.
PLD	PEN LOAD		SWP	Signal used to perform read in time with SWEET SIGNAL during READ. SWEET SIGNAL is output in time with CLOCK.
CHAT				
CUK	COUNT UP CLOCK	WMD		
CDK	COUNT DOWN CLOCK	WMD	SWPP	See TIME CHART. (See Fig.11.)
SWP	SWEET CLOCK	WMD		
CLK (EXT)	OUTPUT of EXTERNAL CLOCK INPUT			<b>(I) CLOCK</b>
CLK (PEN)	CLOCK OUTPUT of PEN MODE			CLOCK (MCLK 1) of 10 MHz coming from IC541 pin 6 changes to CLOCKs of 1 $\mu$ sec, 2 $\mu$ sec, and 5 $\mu$ sec and to CLOCKs of 1 $\mu$ sec, 10 $\mu$ sec, 100 $\mu$ sec and 1 msec processed by IC553, IC563, IC552, IC551, IC540 and IC539. INTERNAL CLOCK for WRITE/READ is determined according to control signals coming from P506 and the setting of SWEET TIME/DIV. IC549 pin 8 is associated with 1 sec/div. (See Fig. 2, 3)
CLK (W & R)	CLOCK OUTPUT of WRITE MODE/READ MODE			
PST	PEN START PEN START signal goes out when the PEN START button gets depressed.			

## CIRCUIT DESCRIPTION

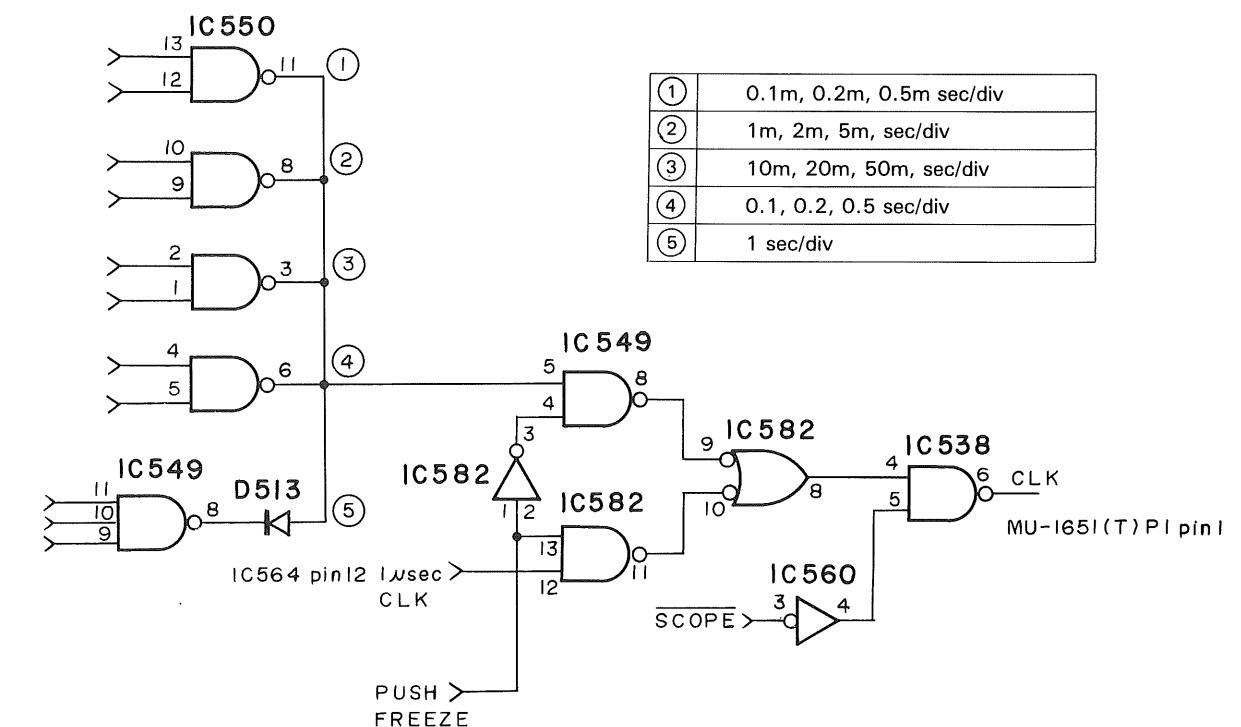

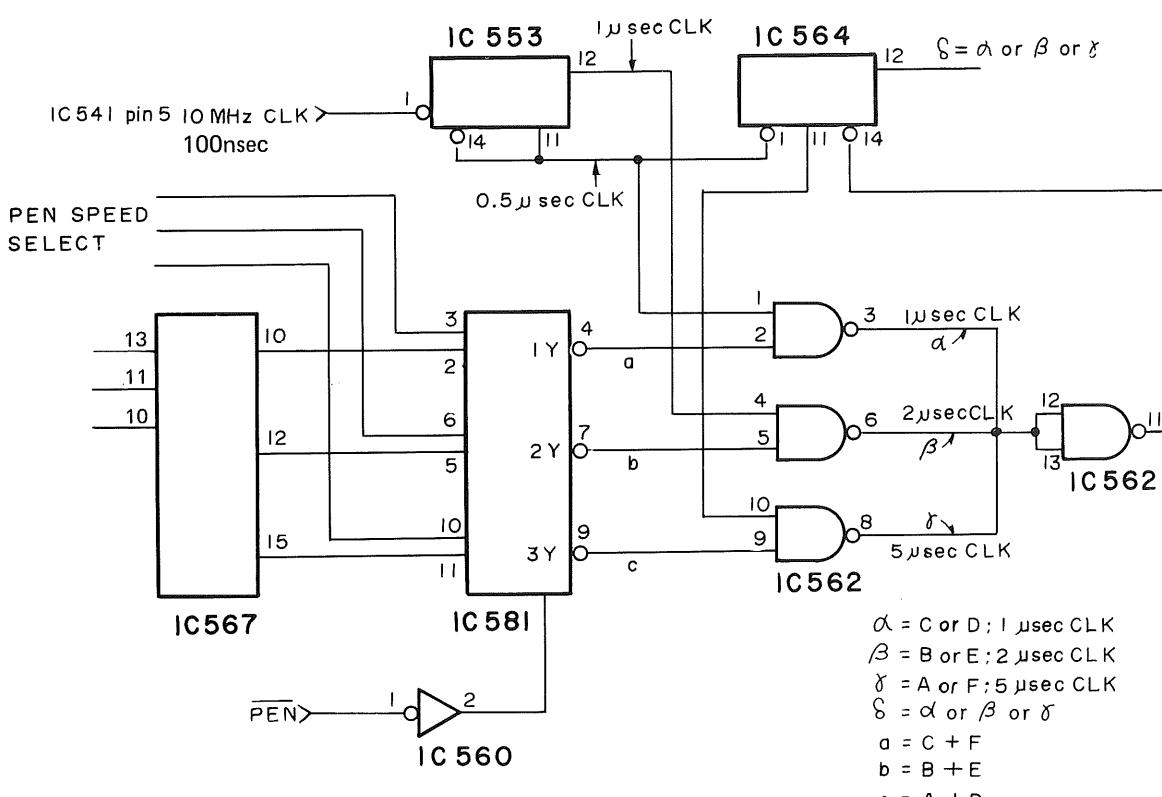

Fig. 2

Fig. 3

## CIRCUIT DESCRIPTION

### (II) WRITE MODE

WRITE mode is entered by WRITE START. It COUNTS DOWN according to -DELAY function (or COUNTs UP during LOAD mode) and waits for trigger. When a trigger comes in, it COUNTs UP and generates LAS signal, terminating WRITE mode. The COUNT DOWN count corresponds to -DELAY and data which have come before the trigger are stored.

After the trigger, therefore, the COUNT UP count is 1024 -COUNT DOWN count.

Address are given right. (Fig. 4)

## (III) READ or PEN MODE

CLK (EXT)	Output when EXTERNAL CLOCK comes in.
CLK (PEN)	CLOCK output during PEN MODE.
CLK (W & R)	CLOCK output during WRITE MODE and PEN MODE.
PST	PEN START PEN START signal goes out when the PEN START button gets depressed.
PRES	PEN RESET PEN-SCOPE signal develops at IC559 pin 3 and one-shot pulse goes out. When PEN MODE is entered with PEN-SCOPE SW depressed, this state gets reset with initial address by PEN LOAD and PEN OUT output changed saturation level.
PSTP	PEN STOP This stops PEN operation started in PEN MODE. The signal developing (at IC569 pin 11) when ADDRESS reaches 1024 is utilized.
PLD	LOAD FOR PEN LOAD signal for PEN. The first address enters ADDRESS COUNTER.
CHAT	Retaining signal while PEN-SCOPE SW is OPEN.
READ	Signal output during READ MODE.
RLD	LOAD FOR READ MODE By SWEEP SIGNAL during READ MODE.
PCLK	PEN CLOCK READ CLOCK during PEN MODE.
RCLK	READ CLOCK READ CLOCK during READ MODE.
WCLK	WRITE CLOCK WRITE CLOCK during WRITE MODE.
RCLK	READ CLOCK READ CLOCK during READ MODE.
LOAD	LOADS the first address of ADDRESS COUNT.
SWP	Signal used to perform read in time with SWEEP SIGNAL during READ. SWEEP SIGNAL is output in time with CLOCK.
SWPP	See TIME CHART. (Fig. 9, 10)
CLK'	CLK (W & R) during READ. CLK (PEN) during PEN.
TCHG	Switches clock. During READ, generates 1-2-5 sequence.

During PEN, generates 1-2-5 sequence.  
(from 10, 20, and 50 msec)

PENSIG Outputs signal for PEN during PEN.

# CIRCUIT DESCRIPTION

## (IV). WRITING

How to enter WRITING state.

All you have to do is put the system in the state in which a trigger signal is waited for as shown in WRITE MODE timing diagram. A red LED lights to indicate WRITE MODE. The easiest way to check WRITING is to see that a signal which has the same waveform as of the input signal is developing at two inputs of COMP (NE529).

<b>WE</b>	Write enable signal which enables write into memory.
<b>WST</b>	A/D conversions start signal.
<b>EOC</b>	Signal indicating the end of A/D conversion and the establishment of digital data.
<b>STROBE</b>	Latch signal.
<b>AD CLK</b>	Address clock signal.
<b>WCLK</b>	Write clock signal.

# CIRCUIT DESCRIPTION

## (V) READING

As the description, timing chart, and circuit diagram of READ MODE, data are read, triggered by LOAD, latched in LAC, converted to analog data and output. Digital data are output through the DATA OUT terminal.

LAC      Latches data of each address read out from

memory and delivered to D/A and DATA OUT.

CL      Clears data latched and makes the outputs of D/A and DATA OUT to saturation level.

VST      Basic switching voltage for the switching transistor of the D/A converter.

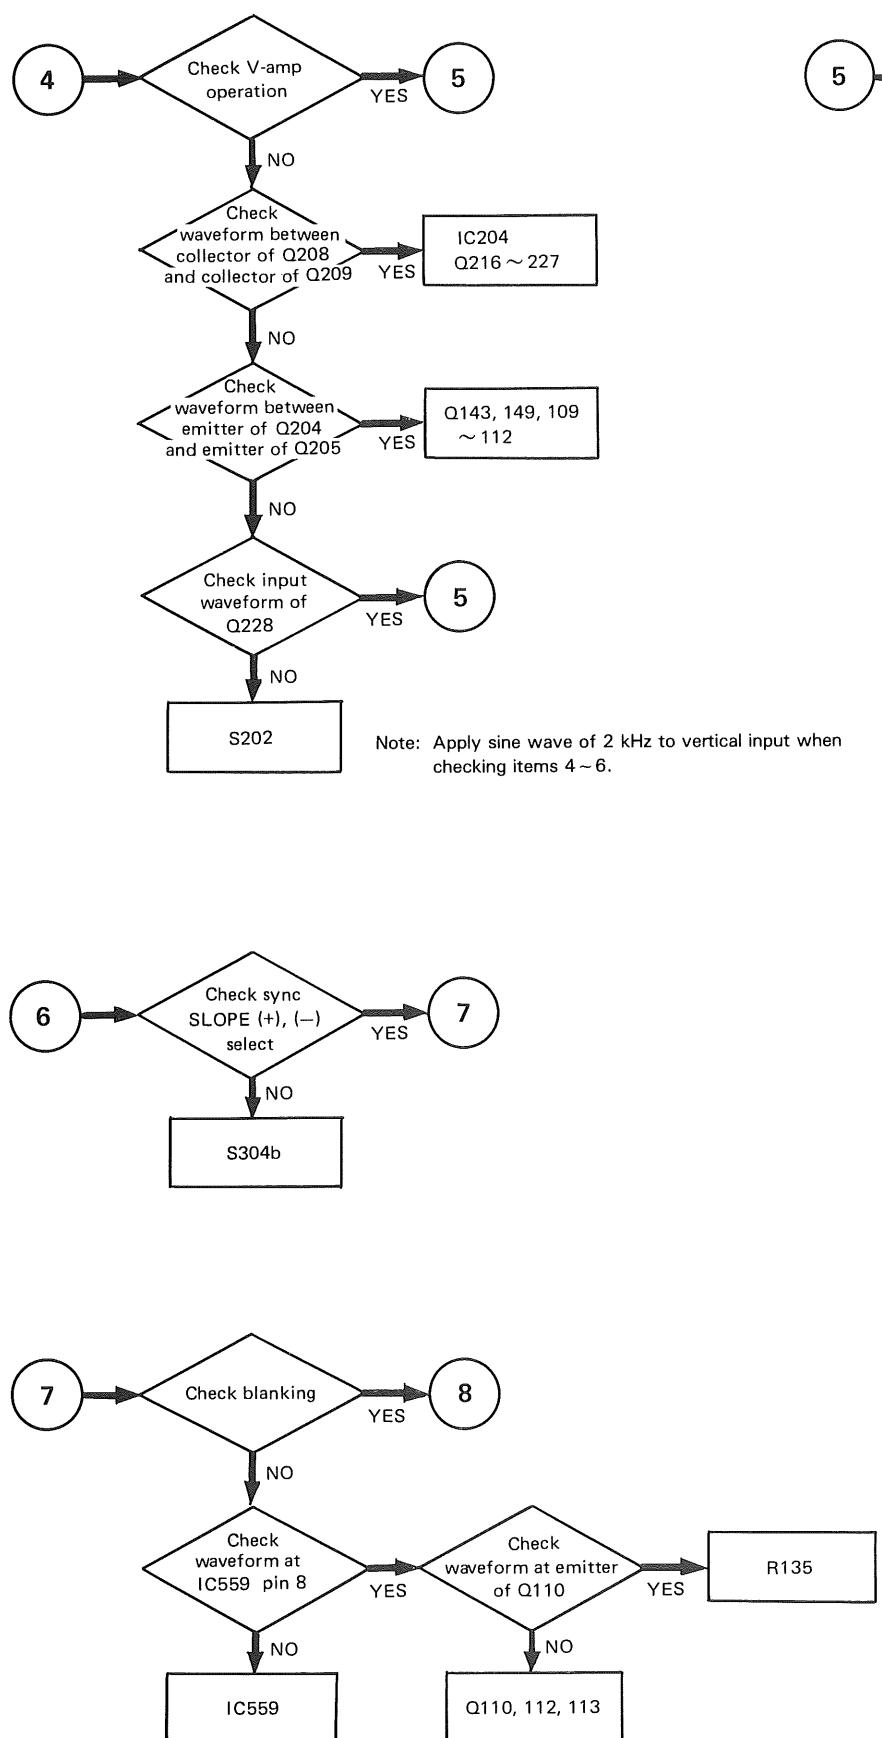

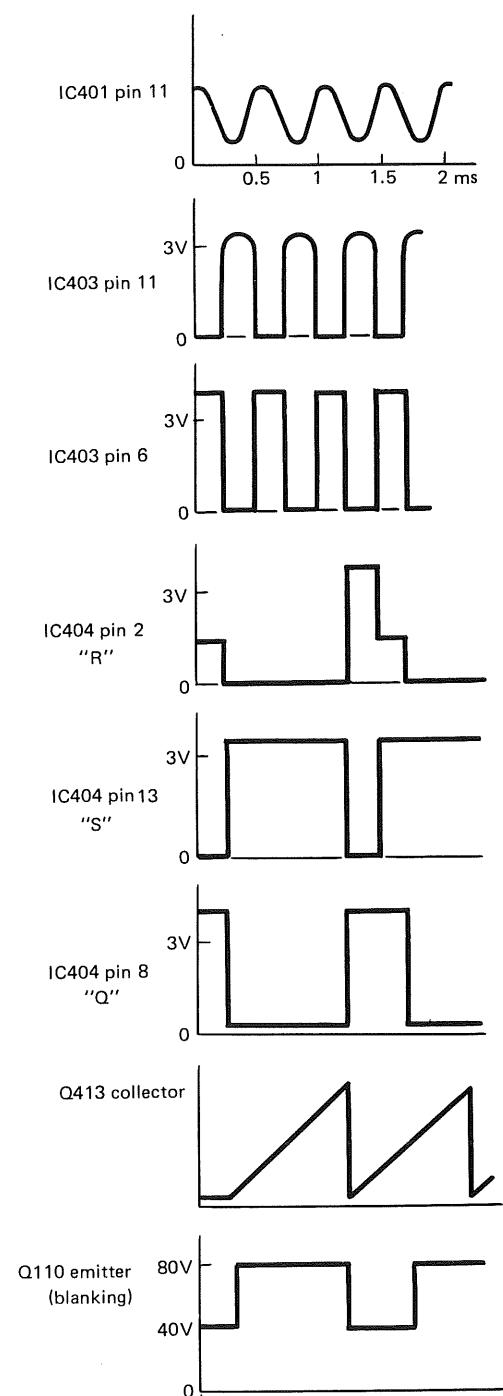

Fig. 15 – Waveform in Sweep Circuit.  
(Input signal 2 kHz, sine wave, SWEEP TIME/ DIV. 0.1 ms/div.)

# ADJUSTMENT: MS-1650B

## CONTROL SETTINGS

The control settings listed below must be used for each adjustment procedure. Exceptions to these settings will be noted as they occur. After completing a adjustment, return the controls to the following settings.

SWEEP TIME/DIV	0.1ms/div
SWEEP VARIABLE	CAL
H POSITION	mechanical center
x 5 MAG	PUSH
INTENSITY	3 o'clock position
TRIG LEVEL	PULL, mechanical center
SOURCE	INT
FOCUS	optimum position
V POSITION	mechanical center
AC-GND-DC	DC
VOLTS/DIV	10 mV/div
V VARIABLE	CAL
FREE RUN	PUSH
DISPLAY MODE	REAL
CLOCK INT/EXT	INT
CLOCK PEN/SCOPE	SCOPE

## TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustments.

Digital multimeter	DL-720	TRIO
Sine wave generator	SG-502	TEKTRONIX
Square wave generator	PG-506	TEKTRONIX
Q meter	4343B	YHP
Oscilloscope	CS-2100A	TRIO
Time marker	TG-501	TEKTRONIX
High voltage probe		
Frequency counter	FC-754A	TRIO

### Check of transformer's primary voltage

1. Select the equipment to 100 V and measure the resistance of the power transformer's winding at the AC input connector.
2. Perform the same procedure with the equipment adapted to each of 120 V, 220 V, and 240 V.  
100 V.....approx 8 Ω      220 V.....approx 36 Ω  
120 V.....approx 9 Ω      240 V.....approx 40 Ω

### Check of power supply voltage

1. Check + 5 V, ± 12 V, + 230 V and + 200 V at check-point on the power supply board.

### - 1.8 kV adjustment

1. Measure the voltage at P103 pin 2 with a dc voltmeter, through a high-tension/high-impedance probe.
2. Adjust VR103 so as to read - 1.8 kV.

## INTENSITY adjustment

1. Set the DISPLAY MODE to X-Y to display a spot.
2. Adjust VR 104 so that the spot disappears when the INTENSITY control is between "9 and 12 o'clock" positions.

## ASTIG adjustment

1. Adjust VR105 to make the trace equally thick everywhere. Perform the ASTIG and FOCUS controls adjustments together. Once adjusted, no readjustment is needed.

## SCALE ILLUM adjustment

1. Make adjustment so that the illumination is bright sufficiently and equally on the screen when rotated the SCALE ILLUM control to maximum clockwise.

## Check of the TRACE ROTATION

1. Rotating the TRACE ROTATION control, check how much the trace varies to the center of the graduation.

## VERTICAL ATT adjustment

Control setting SWEEP TIME/DIV; 0.2 ms/div

1. Apply a 1 kHz, 0.5 - 100 Vp-p square wave signal to the vertical input terminal.
2. Select the VOLTS/DIV control to 0.1 V/div position and adjust TC202 to make the square wave appear best.
3. Make adjustment similary with TC204 then TC206 respectively at 1 V/div and 10 V/div ranges.

## DC BAL adjustment (I)

1. Perform the adjustment below if the trace moves vertically when rotating the VOLTS/DIV control.
2. Set the DISPLAY MODE to REAL position and AC-GND-DC to GND and adjust the V-position control to bring the trace on the center of the screen.
3. Turn the VARIABLE of the vertical attenuator fully counterclockwise. Adjust VR201 so that the trace does not move vertically when rotating the VOLTS/DIV control.

## DC BAL adjustment (II)

1. Perform the adjustment below if the trace moves vertically when rotating the VARIABLE control.
2. Turn the VARIABLE of the vertical attenuator fully counterclockwise and adjust the V-position control to bring the trace to the center of the graduation. Next, turn the VARIABLE control fully clockwise and, if it has moved, bring it back to the center with VR203.
3. Repeat the above steps until the trace stays at the center when turned the VARIABLE.

## V. POSITION adjustment

1. Set the V POSITION control to its mechanical center and bring the trace to the center of the graduation with VR208.

# ADJUSTMENT

## Vertical sensitivity adjustment

Control setting SWEEP TIME/DIV; 0.2 ms/div

1. Select the VOLTS/DIV control to 10 mV/div and turn the VARIABLE control to fully clockwise (CAL position).
2. Apply a 50 mVp-p square wave to the vertical input terminal.
3. Adjust VR205 to display a waveform of 5div vertical amplitude.

## Input capacity adjustment

V input;

1. Set the VOLTS/DIV control to 10 mV/div and measure the input capacity using a Q-meter and note it's value.
2. Adjust TC201 for 0.1 V/div so that the input capacity becomes same as the noted value above.
3. Adjust TC203 for 1 V/div and TC205 for 10 V/div respectively.

HOR input;

1. Check that the input capacity is less than 35 pF with a Q-meter.

## Overshoot adjustment

Control setting VOLTS/DIV; 0.1 V/div, SWEEP TIME/DIV; 2  $\mu$ s/div

1. Apply a 10 kHz or 100 kHz square wave of fast rise time to the vertical input terminal.
2. Adjust middle range of the waveform with TC207.
3. Shape the rise portion of the waveform with VR207.

## Check of the frequency response

Control setting VOLTS/DIV; 0.1 V/div, SWEEP TIME/DIV; 1  $\mu$ s/div. SWEEP TIME/DIV; 1  $\mu$ s/div

1. Using an oscillator of good frequency response, apply a 1 kHz sine wave to the vertical input terminal to display a waveform of 6 div vertical amplitude.
2. Keeping the oscillator's output voltage fixed, check that the amplitude is less than -3 dB at 10 MHz.

## Sweep time adjustment

Control setting VOLTS/DIV; 1 V/div

1. Turn the SWEEP TIME/DIV and VARIABLE controls fully clockwise to CAL.
2. Adjust sweep time with reference to time markers.
3. Adjust VR407 for sweep time of 1 sec to 20 msec.
4. Adjust C431 for sweep time of 10 msec to 0.2 msec.
5. Adjust TC402 for sweep time of 0.1 msec to 2  $\mu$ sec.
6. Adjust TC401 for sweep time of 1  $\mu$ sec.

## Sweep length adjustment

1. Adjust VR406 so that the total length is 11 div with the reference to time marker.

## × 5 MAG adjustment

1. Set the SWEEP TIME/DIV control to 0.1 ms/div and apply a 0.1 msec time marker to the vertical input.
2. Adjust H. POSITION so that 11 shots of pulses appear

each just on a vertical graduation of the screen.

3. With the MAG switch pulled, adjust VR408 so that every interval between pulses becomes 5 div.

## MAG center adjustment

Control setting × 5 MAG; pulled out

1. Set the SWEEP TIME/DIV to 20  $\mu$ s/div and apply a 0.1 msec time marker to the vertical input terminal.
2. Make adjustment so that three shots of pulse appear each just on the left-end, center, and right-end graduation of the screen.
3. With the MAG switch pulled out, adjust VR409 so that the pulse appearing at the center and the center graduation of × 1 stay there.

## EXT H, horizontal position adjustment

1. Set the DISPLAY MODE to EXT H and H POSITION to its mechanical center.
2. Turn the sweep VARIABLE fully clockwise to CAL position.
3. Adjust VR405 so that the spot comes to the middle of the horizontal axis.

## EXT sensitivity adjustment

Control setting DISPLAY MODE ; X-Y

1. Apply a 1.5 Vp-p, 1 kHz sine wave to the HOR INPUT terminal.
2. Adjust VR404 so that the trace extend for 10 div on the screen.

## Trigger level adjustment

1. Apply a 1 kHz sine wave to the vertical input terminal. Set the SOURCE switch to INT position.
2. Adjust VR401 so that, when switched the SLOPE to + and - respectively. The trace starts at the same position on inverted waveforms.

## Trigger start point adjustment

1. In the same setting as in "trigger level adjustment", set the trigger level control at its mechanical center and adjust VR410 so that the trace begins right at the vertical center.

## Check of the sweep start position

1. Bring the spot at the center of the graduation, then let it sweep.

At this time, measure the difference between the left end of the trace and that of the graduation line. (If it exceeds 1 div, make adjustment with R465(4.7 k $\Omega$ )

## Calibration voltage adjustment

1. Apply a calibration voltage to the vertical input terminal. Select the VOLTS/DIV to 0.2 V/div and the SWEEP TIME/DIV to 0.2 ms/div.

# ADJUSTMENT

2. Adjust frequency to 1 kHz with VR102 and duty ratio to 50:50 with VR106.
3. Adjust output voltage to 1 Vp-p with VR101.

## Memory input adjustment

Control setting      DISPLAY MODE; MEMORY

1. Apply a 1.6 Vp-p sine wave to MEMORY INPUT terminal (1) of MS-1650B.
2. Set the MU-1651, UNIT SELECT to UNIT (1) SINGLE.
3. Adjust VR206 so that the amplitude becomes 8 div.

## Memory waveform adjustment

Control setting	AC-GND-DC; DC DISPLAY MODE; REAL FREE RUN; pulled out DISPLAY TIME; fully CCW SOURCE; INT FREEZE; pulled out
-----------------	---

1. Apply approx. 1 kHz triangular wave to MEMORY INPUT terminal to display two cycles of waveform of 6 div vertical amplitude on the screen and memorize it. Then adjust VR503 and VR504 to make a smooth MEMORY waveform as shown below.

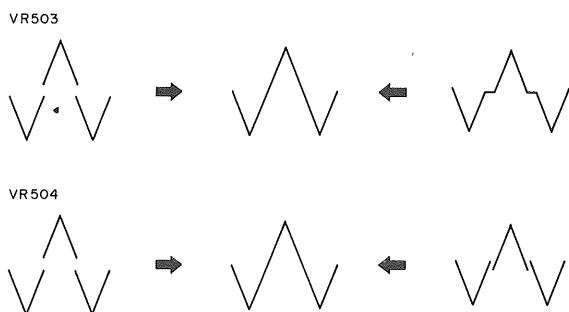

Fig. 16

2. Connect an oscilloscope to MEMORY OUT and observe waveform.
3. Memorize a waveform which extends beyond graduation.
4. Get the top and bottom of the waveform saturated, and adjust its saturation level and gain with VR506 and center level with VR505.
5. The saturation level should be within  $\pm(4+0.2)$  div of the vertical center.
6. Adjust gain of the oscillator so that the waveform amplitude becomes 8 div.
7. Connect an oscilloscope to MEMORY OUT. Observing and writing waveform, adjust MEMORY waveform center level with VR502 and gain with VR501 at 1.6 Vp-p.
8. Set the DISPLAY MODE to REAL, and adjust deviation of REAL and MEMORY waveforms. Adjust gain with VR801 to remove deviation.
9. Memorize the trace along the top and bottom of the graduations. Set the PEN/SCOPE at PEN. And depress

PEN START. Observation MEMORY OUT FOR PEN adjust VR507 to attain +0.8 V at the top and -0.8 V at the bottom.

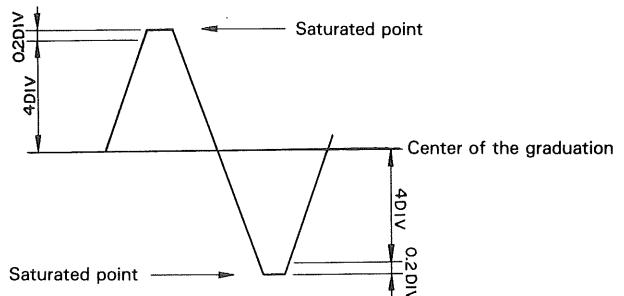

Fig. 17

## Check of FREEZE

Control setting      FREEZE ; pushed in

1. Push and turn on the FREEZE control and check that any new waveform is not written. Next, pull and turn off FREEZE and check that new waveforms may be written.

## Check of minus DELAY

Control setting      FREE RUN; pulled, DISPLAY TIME; fully CCW

1. Memorize a waveform of one cycle at 0 on the CRT screen. Check that it moves by approx. 1 div at every position of up to 9.

## FREE RUN waveform adjustment

Control setting      FREE FUN; pulled out

1. Set the DISPLAY MODE to REAL position. Let 1 kHz appear on the screen. Turn on FREE RUN. Adjust MEMORY waveform along the time base with VR701 so that it fits to REAL waveform.

## MEMORY OUT FOR PEN adjustment

Control setting      CLOCK PEN; pushed in, START

1. Apply a triangular wave to the MS-1650B and adjust the oscillator so that its amplitude becomes 8 div.
2. Start with waveform written and CLOCK at PEN, adjust VR507 so that MEMORY OUT FOR PEN becomes 1.6 Vp-p.

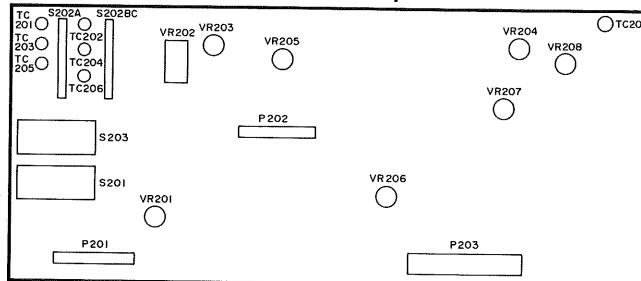

## READ GATE OUT FOR PEN

Control setting      CLOCK PEN; pushed in, START

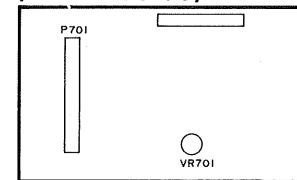

1. Operate PEN START, and READ GATE OUT FOR PEN level varies from Hi to Lo.  
As PEN OUT ends, READ GATE OUT FOR PEN varies from Lo to Hi.

## AMP SECTION

### Sensitivity

5 mV/div-10 V/div,  $\pm 3\%$

### Attenuator

5 mV/div-10 V/div in 1-2-5 sequence, all 11 ranges with fine adjustment.

### Input impedance

1 M $\Omega$   $\pm 3\%$

Approx. 32 pF

### Frequency response

DC: DC-300 kHz (-3 dB)

AC: 2 Hz-300 kHz (-3 dB)

### Maximum input voltage

500 Vp-p or 300 V (DC + AC peak)

### Input over lamp

LED lights up at an input of over approx  $\pm 4$  div

## TRIGGERING

### Output voltage

Approx. 1 V/div

### Output impedance

Approx. 1 k $\Omega$

### Frequency response

DC: DC-300 kHz (-3 dB)

AC: 2 Hz-300 kHz (-3 dB)

HF<sub>REJ</sub>: DC-1.5 kHz (approx. 3 dB attenuation at 1.5 kHz)

## A/D CONVERTER

### Resolution

8 bit (1 word)

### Conversion system

Successive approximation type A/D converter

## MEMORY SECTION

### Memory capacity

1024 words (100 words/div displayed)

### Write speed

Via MS-1650B

INT: 13 ranges selectable 1  $\mu$ s/word-10 ms/word  
(equivalent to 0.1 ms/div-1 s/div )

EXT: Rising edge of EXT CLOCK input signal repetition rate frequency: less than 500 kHz

### Read out speed

Via MS-1650B

SCOPE: Same as write speed

Fixed at 1  $\mu$ s/word for DISPLAY TIME switch at pulled out position.

PEN: 10 ms/word,

20 ms/word,

50 ms/word

3 ranges switchable

With the internal switching, 100ms/word, 200ms/word and 500ms/word are possible.

EXT: Rising edge of EXT CLOCK input signal repetition rate frequency: less than 1 MHz

### Delay

Via MS-1650B

0-9 divisions (adjustable each 1 div step on the screen)

## D/A CONVERTER

Memory out for scope: 1.72 V  $\pm 3\%$  full scale

Memory out for pen: 1.72 V  $\pm 3\%$  full scale

Output impedance: Approx. 430  $\Omega$

(Output of only PEN mode)

## OPERATING TEMPERATURE

0°C — 40°C, Less than 80% of relative humidity

## FULL OPERATING TEMPERATURE

0°C — 50°C, Less than 80% of relative humidity

## POWER SUPPLY

### Line voltage

AC100/120/220/240 V  $\pm 10\%$  (50/60 Hz)

Selectable by internal wiring

### Power consumption

Approx. 15 W

## WEIGHT

Approx. 4.0 kg

## DIMENSIONS

Connection cable (CB-2402F)

BNC cable (CA-34)

Replacement fuse 0.2A

0.4A

# CIRCUIT DESCRIPTION; MU-1651(T), and MU-1652(T)

The AMP UNIT (X73-1460-00) amplifies or attenuates the input signal of a certain level and its signal is converted the output signal of 3 Vp-p at full scale and is fed to the MEMORY UNIT (X81-1170-00 or X81-1310-00).

After amplified further to 8 Vp-p at full scale, the signal passes through the TRIGGERING switching circuit to TRIG OUT.

In the MEMORY UNIT, the output signal passed the AMP UNIT is converted to digital signal according to control signals coming from the MS-1650B, stored in C-MOS memory, converted back to analog signal, and output to MEMORY OUT. The waveform is observed on the CRT of the MS-1650B, and it is possible to produce hard copy of analog signal coming from PEN OUT.

Digital data are output through the DATA OUT terminal. The POWER SUPPLY UNIT (X68-1380-00) not only supplies power to the AMP UNIT and MEMORY UNIT but also relays control signals coming from the MS-1650B.

The control signals control operations of the MEMORY UNIT such as WRITE/READ, become controls signals such as DISPLAY MODE and UNIT SELECT of the AMP UNIT and POSITION SET of the rear panel, and control the VERTICAL SUB UNIT (X73-1470-00) of the MS-1560B to control operation of the CRT display.

The MU-1651 is also capable of suspending WRITE operation of the MEMORY UNIT with FREEZE switch.

# ADJUSTMENT; MU-1651(T), and MU-1652(T)

The control setting listed below must be used for each adjustment procedure. Exceptions to these settings will be noted as they occur. After completing an adjustment, return the controls to the following settings.

## MU-1651

### Control Setting

POWER	ON
AC-GND-DC	DC
VOLTS/DIV	5 mV/div
VARIABLE	CAL
REAL POSITION	12 o'clock position
MEMORY POSITION	12 o'clock position
PUSH FREEZE	PULL
UNIT SELECT	MAIN
DISPLAY MODE	SINGLE
TRIG COUPLING	DC
POSITION SET	1 (on Back panel)

## MS-1650B

### Control setting

POWER	ON
INTENSITY	3 o'clock position
FOCUS	Optimum position
VOLTS/DIV	1 V/div
V. VARIABLE	CAL
AC-GND-DC	DC
DISPLAY MODE	REAL
PULL FREE RUN	PUSH
V. POSITION	12 o'clock position
MEMORY POSITION	12 o'clock position
TRIG POINT(-DELAY)	0
CLOCK INT/EXT	INT
PEN/SCOPE	SCOPE
SWEEP TIME/DIV	1 ms/div
H. VARIABLE	CAL
H.POSITION	12 o'clock position
FINE	12 o'clock position
PULL × 5 MAG	PUSH
PEN SPEED	10 ms/word
TRIG SOURCE	INT
TRIG SLOPE	+
TRIG LEVEL	12 o'clock position
PULL AUTO	PULL

## Adjustment of the power supply

- Turn on power and make sure that the POWER LED lights.
- Check the voltage at CP 2 and adjust VR 1 to read 12.0 V.
- Check the voltage at CP 3 and CP 4 and make sure that you read  $-12 \pm 0.3$  V and  $+5 \pm 0.2$  V respectively.

## ADJUSTMENT OF THE AMP UNIT

### Control setting

REAL POSITION: 12 o'clock position

AC-GND-DC: GND

## DC OFFSET adjustment

- Turn OFF (rear panel side)S 7 (X73-1460-00) and adjust voltage to 0 V at the pins given below.

Pin	Control adjustment	Voltage
①	VR 1(coarse) VR 2(vernier)	0 V $\pm 0.2$ mV
②	VR4	0 V $\pm 2$ mV
③	VR6	0 V $\pm 10$ mV
④	VR7	0 V $\pm 10$ mV
⑤	VR12	0 V $\pm 10$ mV
⑥	VR14	0 V $\pm 10$ mV

- Turn ON (front panel side)S 7(X73-1460-00) and adjust voltage to 0 V at the pins given below.

Pin	Control adjustment	Voltage
④	VR9	0 V $\pm 10$ mV

## Checking of STEP ATT BAL.

Control setting VOLTS/DIV; 1 V/div (MS-1650B)

- Connect a BNC-BNC cable between MU-1651 TRIG OUT terminal and MS-1650B vertical input terminal and observe the real time trace.
- Make sure that, when turned the VOLTS/DIV control, the trace does not move vertically.

## Checking of VARI BAL.

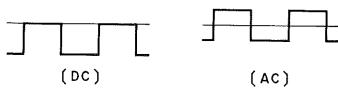

Control setting VOLTS/DIV; 1 V/div(MS-1650B)

- Connect a BNC-BNC cable between MU-1651 TRIG OUT terminal and MS-1650B vertical input terminal and observe the real time trace.
- Make sure that, when turned the V.VARIABLE control, the trace does not move vertically.

# ADJUSTMENT

## Checking of AC-GND-DC switch

1. Connect a BNC-BNC cable between MU-1651 TRIG OUT terminal and MS-1650B vertical input terminal and observe the trace.
2. Apply a 1 kHz square wave signal to MU-1651 vertical input terminal and check that the waveform varies as shown below when switched the AC-GND-DC switch to from AC to DC.

**Fig. 25**

3. The trace should not move more than 0.2div when operated the AC-GND-DC with no signal applied.

## Waveform shaping

1. Observe the TRIG OUT signal with an oscilloscope.
2. Apply a 10 kHz square wave signal to MU-1651 INPUT terminal to display a waveform of 6 div vertical amplitude.
3. Make adjustment with trimmers listed below so that the waveform is the best when turned the VOLTS/DIV.

VOLTS/DIV setting	Adjustment control
50 mV	TC4
0.5 V	TC5
5 V	TC6

## Input capacity adjustment

Control setting, VOLTS/DIV; 5 mV/div

1. Check that the input capacity is  $32 \text{ pF} \pm 3 \text{ pF}$ .
2. Make adjustment with trimmers listed below so that the input capacity do not vary when turned the VOLTS/DIV.

VOLTS/DIV setting	Adjustment control
50 mV	TC 1
0.5 V	TC 2
5 V	TC 3

## GAIN adjustment

Control setting AC-GND-DC; AC

1. Apply a 1 kHz sine wave signal of full scale to INPUT terminal (VOLTS/DIV setting by 8 division) (see note).
2. Checking the voltage with DMM(digital multi meter). Make adjustment as given below.

Pin	VOLTAGE	Adj.control
⑤	1.06 Vrms (3 Vp-p)	VR 3
⑥	2.83 Vrms (8 Vp-p)	VR13

**Note;** Signals of full scale are as follows.

VOLTS/DIV	Voltage(p-p)	Voltage(rms)
5 mV	40 mVp-p	14.14 mVrms
20 mV	160 mVp-p	56.57 mVrms

## OVER LEVEL LED adjustment

1. Apply a 1 kHz sine wave signal whose amplitude is 8.2 times of VOLTS/DIV setting (see note).
2. Turn VR11 until the “+” LED lights. Then turn VR11 reversely just until the LED goes out.
3. Make adjustment for the “-” LED in the same way with VR10.

**Note;**

VOLTS/DIV	Voltage(p-p)	Voltage(rms)
5 mV	41 mVp-p	14.50 mVrms
20 mV	164 mVp-p	57.98 mVrms

## Adjustment of memory unit

A special jig is required to adjust the memory unit, (R/W (READ/WRITE) jig), and it is fitted up in the following sequence (see Fig. 26).

1. First turn off the set's POWER switch, and connect the R/W jig to P1 on the memory unit (disconnect connector P1 from the power supply).
2. Wire up P5 on the R/W jig to P5 on the memory unit.
3. Attach the clip of the R/W jig to pin 16 (5 V line) of IC 12 on the memory unit.
4. Disconnect connector P2 from the memory unit.
5. Cut out the 2 jumpers (in front of VR2 at the front right as seen from the front, and to the left of R54 on the left of the unit).

### CAUTION:

1. When adjusting the memory unit, input the supply test voltage directly to P2 unless otherwise specified.
2. When adjusting the memory unit, use test point 3 (TP3) on the earth side for voltage measurements.
3. Before making adjustments, check that the 2 jumpers are out of circuit.

# ADJUSTMENT

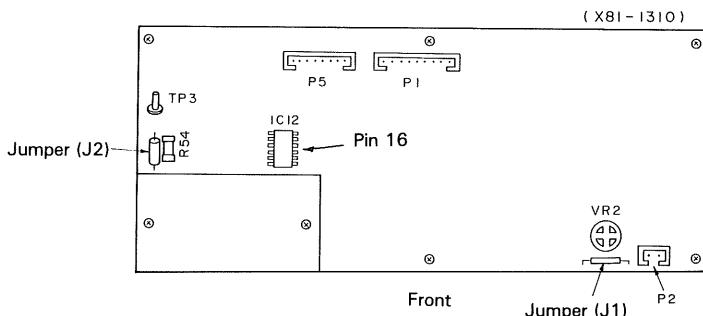

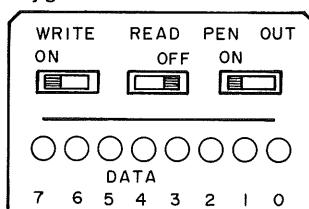

Fig. 26

- When adjusting the memory unit, adjust to a higher precision than the specification. The specification corresponds to the values obtained when carrying out a re-check after making adjustments. Take readings with a digital multimeter.

Set the R/W jig as follows:

Illumination is indicated by 1, and non-illumination by 0.

Fig. 27

## D/A OUT full-scale adjustment (J<sub>1</sub>, J<sub>2</sub> open)

Supply 5 V DC to connector P2 on the memory unit from a DC power supply (denoted hereafter as DC standard), and then measure the voltage at TP1. Check that the voltage at TP1 does not vary even if DC standard is greater than 5 V (i.e. TP1 is saturated).

If the latter does vary, make the voltage a saturating voltage by supplying more than 5 V.

Let the voltage at this time be E<sub>2</sub>. Adjust VR4 such that E<sub>2</sub> satisfies the equation:

$$E_2 = (E_1 + 1.72) \pm 3 \text{ mV}$$

Specification	1.72 V ± 10 mV
---------------	----------------

## D/A OUT offset adjustment (J<sub>2</sub> shorted)

Connect jumper J<sub>2</sub>. By varying DC standard, apply a voltage to P2 within the range 1.6 V ± 0.5 V. Adjust the DC standard output voltage such that the LED of the R/W jig indicates 7F (7F shows, in 16-bit code, that the LED of the R/W jig is 01111111).

Then adjust VR5 such that the voltage at TP1 is 0 V ± 3 mV.

### CAUTION:

If jumper J<sub>2</sub> is connected, the voltage at TP1 is halved.

Specification	0 V ± 10 mV
---------------	-------------

## A/D OUT offset adjustment (J<sub>1</sub>, J<sub>2</sub> shorted)

Connect jumper J<sub>1</sub>. Adjust VR2 such that when P2 is shorted, the LED of the R/W jig indicates 7F.

## A/D OUT full-scale adjustment (J<sub>1</sub>, J<sub>2</sub> shorted)

Apply 1.6 V to P2 from DC standard. Adjust VR6 such that the voltage at TP2 is 0.8 V ± 3 mV.

Specification	0.8 V ± 10 mV
---------------	---------------

## Checking A/D, D/A (J<sub>1</sub>, J<sub>2</sub> shorted)

Check that, when the following voltages are input to P2, the voltages at TP1 are as given in the table below:

P2 input voltage	Voltage at TP1
0 V	0 V ± 10 mV
1.6 V	0.8 V ± 10 mV
-1.6 V	-0.8 V ± 10 mV

## Checking DC offset on PEN OUT

Check that PEN OUT of the R/W jig is ON. Short P2 and measure voltage at TP2. Let the voltage at this time be E<sub>4</sub>. Check that E<sub>4</sub> is within specification.

Specification	0 V ± 10 mV
---------------	-------------

## PEN OUT full-scale adjustment

Input 1.72 V to P2 from DC standard, and measure voltage at TP2. Let voltage at this time be E<sub>5</sub>. Adjust VR6 such that E<sub>5</sub> satisfies the relation:

$$E_5 = (E_4 + 0.86 V) \pm 3 \text{ mV}$$

Specification	E <sub>5</sub> = (E <sub>4</sub> + 0.86 V) ± 3 mV
---------------	---

## Checking PEN OUT A/D, D/A

Check that, when the following voltages are input to P2 from DC standard, the voltages at TP2 are as given in the table below:

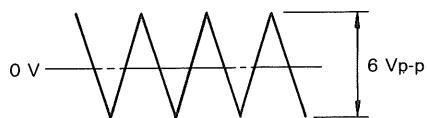

P2 input voltage	Voltage at TP2
0 V	0 V ± 10 mV
1.6 V	0.8 V ± 20 mV
-1.6 V	-0.8 V ± 20 mV

# ADJUSTMENT

## Linearity check on MEMORY OUT

Apply the voltages in the table below to P2 from DC standard, and check that the voltages at the PEN OUT and FOR SCOPE terminals on the rear of the set correspond to the following values:

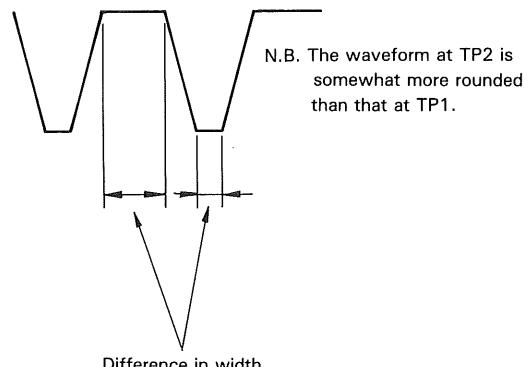

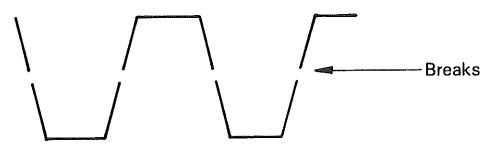

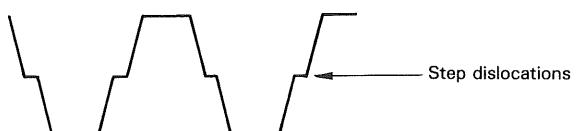

P2 input voltage	PEN OUT terminal	FOR SCOPE terminal
Short	0 V ± 10 mV	0 V ± 10 mV
0.4 V	0.2 V ± 20 mV	0.2 V ± 10 mV
0.8 V	0.4 V ± 20 mV	0.4 V ± 10 mV
1.2 V	0.6 V ± 20 mV	0.6 V ± 10 mV
1.6 V	0.8 V ± 20 mV	0.8 V ± 10 mV
More than 2 V	Saturated at more than 0.86 V	Saturated at more than 0.86 V
-0.4 V	-0.2 V ± 20 mV	-0.2 V ± 10 mV
-0.8 V	-0.4 V ± 20 mV	-0.4 V ± 10 mV
-1.2 V	-0.6 V ± 20 mV	-0.6 V ± 10 mV
-1.6 V	-0.8 V ± 20 mV	-0.8 V ± 10 mV
More than -2 V	Saturated at more than -0.86 V	Saturated at more than -0.86 V

Chopping wave of frequency approx. 1 kHz

Fig. 28

Observe the points TP1 and TP2 on the oscilloscope by means of a probe. Check the waveforms do not have any of the features shown below:

Note: The above are unsatisfactory, and constants, etc., must therefore be revised.

Fig. 29

# ADJUSTMENT

## Checking UNIT SELECT DISPLAY MODE

The 3 MU-1651 (-T) are first connected up, and the waveforms for MS-1650B and each unit are memorized.

### • DISPLAY MODE→SINGLE

Switch UNIT SELECT from MAIN through UNIT 3, and check the corresponding memorized waveforms are displayed in a single mode.

### • DISPLAY MODE→MULTI 8 DIV

#### UNIT SELECT→QUAD

Check the memorized waveforms on MAIN, UNIT 1, UNIT 2 and UNIT 3 are displayed in quad-trace.

Check also that when DISPLAY MODE is set to 4 DIV and 2 DIV, the amplitudes of the corresponding waveforms are cut to 1/2 and 1/4 respectively.

### • UNIT SELECT→DUAL

Check that when UNIT SELECT is switched from UNIT 1 through UNIT 3, the waveforms for MAIN and UNIT 1, MAIN and UNIT 2, MAIN and UNIT 3 are displayed in dual-trace.

## Checking POSITION SET

### MU-1651

UNIT SELECT→QUAD, DISPLAY MODE→MULTI

### MS-1650B

DISPLAY MODE→MEMORY

Set for quad-trace operation as described above. Switching through POSITION SET and operating MEMORY POSITION, check the unit behaves as follows:

#### POSITION SET→ALL

The positions of all waveforms, from UNIT 1 through UNIT 3, are controlled by turning the MEMORY POSITION.

#### POSITION SET→1

The position of the waveform for UNIT 1 is controlled.

#### POSITION SET→2

The position of the waveform for UNIT 2 is controlled.

#### POSITION SET→3

The position of the waveform for UNIT 3 is controlled.

## Checking variable range of MEMORY POSITION

UNIT SELECT→ALL

Measures the voltage on pin 25 of connector P9 of the power unit (X68-1380). Check that when the MEMORY POSITION control is set as follows, the pin voltages are as given below:

#### Control

Full clockwise rotation.....more than -1.5 V

Full counterclockwise rotation.....more than +1.5 V

12 'o' clock position.....0 V±0.75 V

## Checking PUSH FREEZE

### MU-1651

AC-GND-DC→DC, PUSH FREEZE→PULL  
UNIT SELECT→UNIT 1, DISPLAY MODE→SINGLE

### MS-1650B

DISPLAY MODE→REAL, PULL FREE RUN→PULL  
DISPLAY TIME→MIN, TRIG SOURCE→EXT  
PULL AUTO→AUTO

Input a suitable signal, and memorize the waveform in the FREE RUN mode above.

Then, FREEZE the unit by pushing the PUSH FREEZE button. Set AC-GND-DC to GND, and check that the memorized waveform has been retained.

Switch POWER SW to OFF, leave a certain time to elapse, and switch POWER SW to ON again. Check that the memorized waveform has been retained.

## Checking AUTO FREEZE (MU-1652(T) only)

Set POSITION SET at rear to 3.

Pull the PULL FREERUN (PULL WRITE/READ) control of MS-1650B, set DISPLAY MODE to REAL, and set TRIG control to PULL (AUTO). Apply a suitable signal to the input terminals, and display it on the screen of MS-1650B.

By varying the PULL FREERUN control on MS-1650B, set DISPLAY TIME so that WRITE/READ operation is easily visible.

Observe WRITE/READ lamp of MS-1650B and FREEZE lamp on the unit. Check that when AUTO FREEZE is set to AUTO-RESET, WRITE/READ of MS-1650B flashes on and off 4 times, and the FREEZE lamp on the unit lights up green.

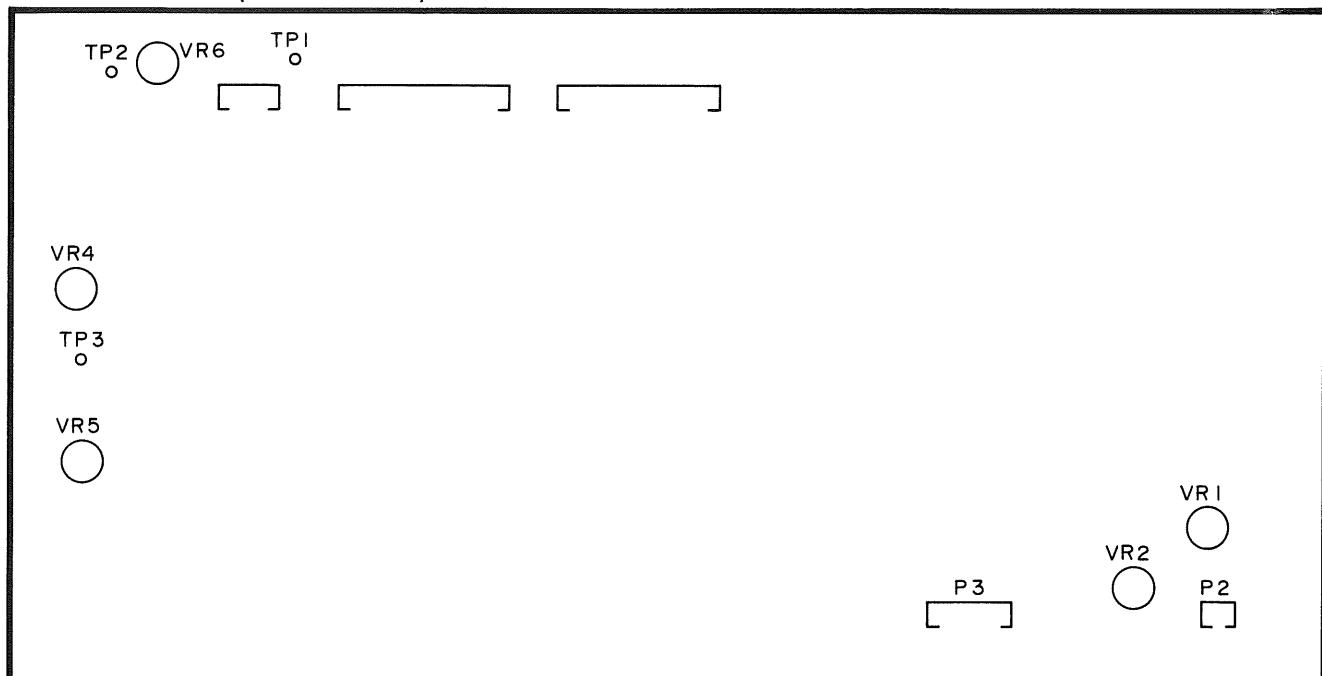

#### Note:

When toggle switch is set to upper position, AUTO FREEZE is "NORMAL" and has the same functions as MU-1651. When the switch is set to lower position, the unit is RESET, and the FREEZE condition is released. When MS-1650B is set to REAL, and DISPLAY TIME is set to PULL, the unit enters the WRITE condition, i.e. the trigger waiting condition.

When the no. of times for FREEZE is set with POSITION SET and the unit is RESET by the AUTO FREEZE switch, AUTO FREEZE can then be executed by setting MS-1650B to FREE RUN.

# ADJUSTMENT

## MEMORY UNIT (X-81-1310-00)

## AMP UNIT (X73-1460-00)

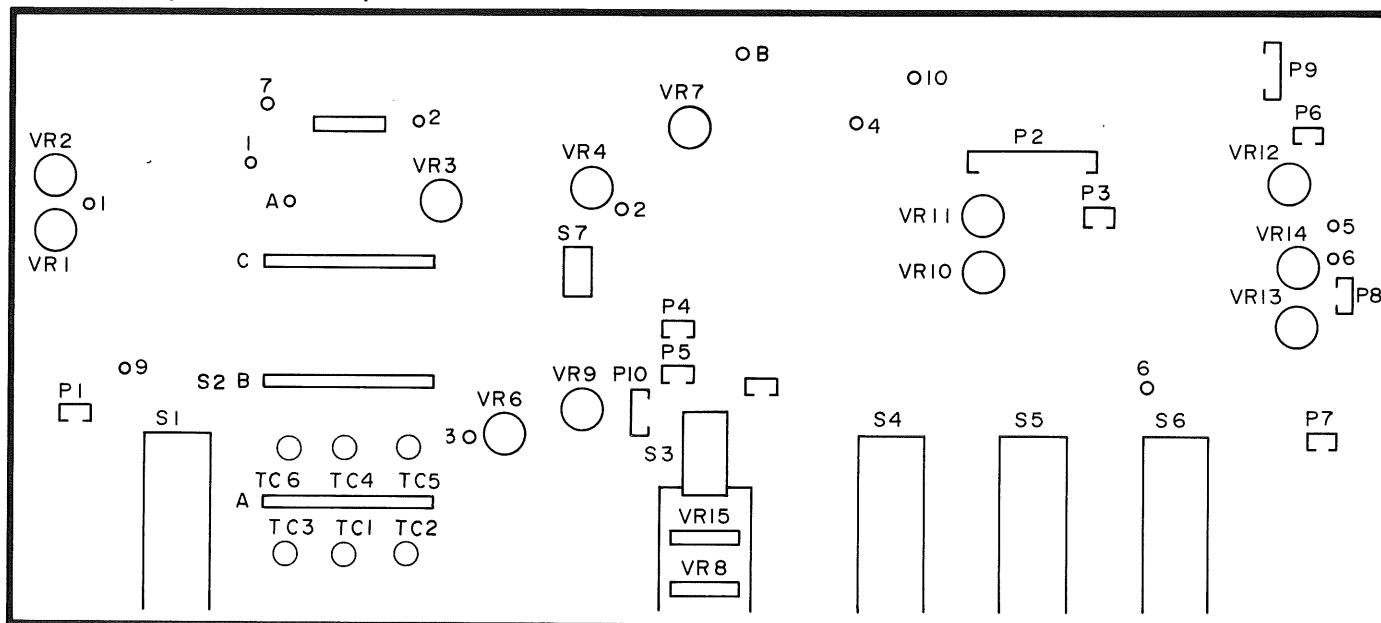

Fig. 30 Location of Adjustment Control

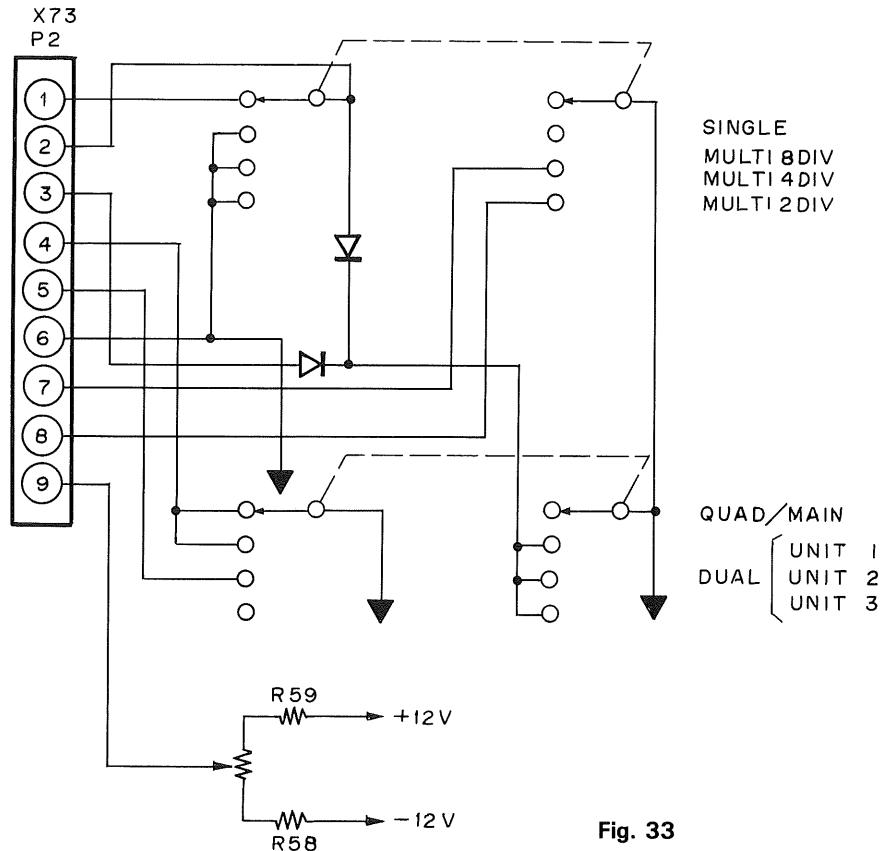

Fig. 33

## Independent operation of the MU-1651(T), MU-1652(T)

The device shown below is helpful to check and adjust

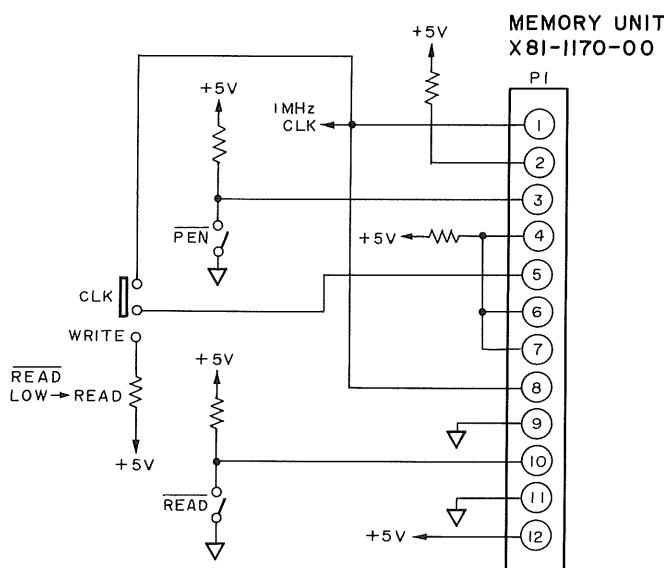

Fig. 34

## Device for independent operation of the MU-1651

Switch

PEN;

When this switch is on, data coming from D/A develops at the PEN OUT terminal.

READ;

When this switch is on, data may be read from the memory. The WRITE

WRITE/READ function of the memory unit when the MU-1651 is used independently.

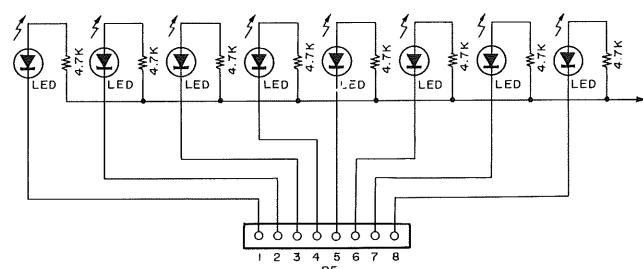

Fig. 35 MU-1651 Jig

switch below may also be used to enter READ mode.

When this switch is set at CLK, write to the memory becomes possible. At this time, the READ switch must be off. When this switch is set at WRITE, write data is output from D/A.

IC1		IC TIMER	NE555
IC2		IC TTL	SN7432
D1 ~ 4		Diode	1N34
D5		Diode	1S953
P601	E40-7002-08	Pin connector	12P

# PARTS LIST; MU-1651(T)

## MU-1651(T) CHASSIS ASSEMBLY

REF. NO	PARTS NO	NAME & DESCRIPTION
