PHONOGRAPH CONNECTION

I.F. ALIGNMENT: The step-by-step routine given below should be carefully followed;

1. The signal generator must be set at 455 kilocycles.
2. Connect the output meter so that the output can be determined.
3. Connect the high side of the signal generator output to the antenna lead of the tuner, the white wire. The low side of the signal generator output lead is connected to the chassis through a 0.01 mfd. condenser.
4. Turn the volume control on full and turn the dial drive shaft so that the slugs of the tuner unit are all the way out against the stop.
5. Adjust the four I.F. trimmers, tuning each carefully to get the maximum deflection of the output meter. Reduce the signal generator output if the output meter goes off scale.
6. Repeat all four adjustments since the adjustment of each I.F. trimmer may effect the others to a certain extent.

OSCILLATOR and R.F. ALIGNMENT:

1. Connect the high side of the signal generator output to the insulation covering of the antenna wire and not the wire itself.
2. Set the signal generator to 1680 kilocycles with the slugs of the tuner all the way out against the stop. Adjust the oscillator trimmer, right hand trimmer screw, for maximum reading on the output meter.
3. Set the signal generator at 1120 kilocycles and turn the dial drive shaft until the 1120 kilocycle note is heard. Adjust the R.F. trimmer, left hand trimmer, for maximum reading on the output meter. Set the dial pointer on 1120 kilocycles on the dial scale. By aligning the R.F. section at 1120 kilocycles the overall alignment will be very good.
